Everyone ought to realize that "Wikipedia" data can be written by
ANYONE
and that the ARRL (who has always published QST) is NOT a technical-
expertise source.  Ed Armstrong's original patent on the
superheterodyne
can be found on the 'web in digitized image form.  Takes some
searching.

The word prefix 'super' generally refers to something 'better' than
the word
without that prefix.  Armstrong got a patent for the regenerative
detector,  He
also got a patent for a SUPER-Regenerative detector.

Think also SUPERman.  'Mercado' has already been mentioned, but folks
have neglected the MARKET...which expanded into SUPERmarket, generally
a chain of them under one label or another.

A 5-tubes superhet receiver made in Japan about 1955.In electronics, the superheterodyne receiver (also known as the supersonic heterodyne receiver, or by the abbreviated form superhet) is a receiver which uses the principle of frequency mixing or heterodyning to convert the received signal to a lower (sometimes higher) "intermediate" frequency, which can be more conveniently processed than the original carrier frequency. Virtually all modern radio and TV receivers use the Superheterodyne principle.

[edit] History

Two section variable capacitor, used in superhet receiverThe word heterodyne is derived from the Greek roots hetero- "different", and -dyne "power". The original heterodyne technique was pioneered by Canadian inventor-engineer Reginald Fessenden but was not pursued far because local oscillators were not very stable at the time.[1]

Later, the superheterodyne (superhet) principle was conceived in 1918 by Edwin Armstrong during World War I, as a means of overcoming the deficiencies of early vacuum triodes used as high-frequency amplifiers in radio direction finding (RDF) equipment. Unlike simple radio communication, which only needs to make transmitted signals audible, RDF requires actual measurements of received signal strength, which necessitates linear amplification of the actual carrier wave.

In a triode RF amplifier, if both the plate and grid are connected to resonant circuits tuned to the same frequency, stray capacitive coupling between the grid and the plate will cause the amplifier to go into oscillation if the stage gain is much more than unity. In early designs, dozens (in some cases over 100) low-gain triode stages had to be connected in cascade to make workable equipment, which drew enormous amounts of power in operation and required a team of maintenance engineers. The strategic value was so high, however, that the British Admiralty felt the high cost was justified.

Armstrong had realized that if RDF could be operated at a higher frequency, it would allow detection of enemy shipping much more effectively, but at the time, no practical "short wave" amplifier existed, (defined then as any frequency above 500 kHz) due to the limitations of triodes of the day.

A "heterodyne" refers a beat or "difference" frequency produced when two or more radio frequency carrier waves are fed to a detector. The term was originally coined by Canadian Engineer Reginald Fessenden describing his proposed method of making Morse Code transmissions from an Alexanderson alternator type transmitter audible. With the Spark gap transmitters then in wide use, the Morse Code signal consisted of short bursts of a heavily modulated carrier wave which could be clearly heard as a series of short chirps or buzzes in the receiver's headphones.

The signal from an Alexanderson Alternator on the other hand, did not have any such inherent modulation and Morse Code from one of those would only be heard as a series of clicks or thumps. Fessenden's idea was to run two Alexanderson Alternators, one producing a carrier frequency 3kHz higher than the other. In the receiver's detector the two carriers would beat together to produce a 3kHz tone and so in the headphones the morse signals would then be heard as a series of 3kHz beeps. For this he coined the term "heterodyne" meaning "Generated by a Difference" (in frequency).

Later, when vacuum triodes became available, the same result could be achieved more conveniently by incorporating a "local oscillator" in the receiver, which became known as a "Beat Frequency Oscillator" or BFO. As the BFO frequency was varied, the pitch of the heterodyne could be heard to vary with it. If the frequences were too far apart the heterodyne became supersonic and hence no longert audible.

It had been noticed some time before that if a regenerative receiver was allowed to go into oscillation, other receivers nearby would suddenly start picking up stations on frequencies different from those that the stations were actually transmitted on. Armstrong (and others) eventually deduced that this was caused by a "supersonic heterodyne" between the station's carrier frequency and the oscillator frequency. Thus, for example, if a station was transmitting on 300 kHz and the oscillating receiver was set to 400 kHz, the station would be heard not only at the original 300 kHz, but also at 100 kHz and 700 kHz.

Armstrong realized that this was a potential solution to the "short wave" amplification problem, since the beat frequency still retained its original moduation, but on a lower carrier frequency. To monitor a frequency of 1500 kHz for example, he could set up an oscillator to say, 1560 kHz, which would produce a heterodyne of 60kHz, a frequency that could then be much more conveniently amplified by the triodes of the day. He termed this the "Intermediate Frequency" often abbreviated to "IF"

Early Superheterodyne receivers actually used IFs as low as 20 kHz, often based around the self-resonance of iron-cored transformers. This made them extremely susceptible to image frequency interference, but at the time, the main objective was sensitivity rather than selectivity. Using this technique, a small number triodes could be made to do work that formerly required dozens or even hundreds.

1920s commercial IF transformers actually look very similar to 1920s audio interstage coupling transformers, and were wired up in an almost identical manner. By the mid-1930s superhets were using much higher intermediate frequencies, (typically around 440-470kHz), using tuned coils very similar in construction to the aerial and oscillator coils. However the term "Intermediate Frequency Transformer" or "IFT" still persists to this day.

Modern receivers typically use a mixture of Ceramic Filters and/or Saw Resonators as well as traditional tuned-inductor IF transformers

Armstrong was able to put his ideas into practice quite quickly, and the technique was rapidly adopted by the military. However, it was less popular when commercial radio broadcasting began in the 1920s. There were many factors involved,but the main issues were the need for an extra tube for the oscillator, the generally higher cost of the receiver, and the level of technical skill required to operate it. For early domestic radios, Tuned RFs ("TRF"), also called the Neutrodyne, were much more popular because they were cheaper, easier for a non-technical owner to use, and less costly to operate. Armstrong eventually sold his superheterodyne patent to Westinghouse, who then sold it to RCA, the latter monopolizing the market for superheterodyne receivers until 1930.[2]

By the 1930s, improvements in vacuum tube technology rapidly eroded the TRF receiver's cost advantages, and the explosion in the number of broadcasting stations created a demand for cheaper, higher-performance receivers.

First, the development of practical indirectly-heated-cathode tubes allowed the mixer and oscillator functions to be combined in a single Pentode tube, in the so-called Autodyne mixer. This was rapidly followed by the introduction of low-cost multi-element tubes specifically designed for superheterodyne operation. These allowed the use of much higher Intermediate Frequencies (typically around 440-470kHz) which eliminated the problem of image frequency interference. By the mid-30s, for commercial receiver production the TRF technique was obsolete.

The superheterodyne principle was eventually taken up for virtually all commercial radio and TV designs.

[edit] Overview

The superhet receiver consists of three principle parts, the local oscillator, a mixer that mixes the local oscillator's signal with the received signal, and a tuned amplifier.

Reception starts with an antenna signal, optionally amplified, including the frequency the user wishes to tune, fd. The local oscillator is tuned to produce a frequency close to fd, fLO. The received signal is mixed with the local oscillator's, producing four frequencies in the output; the original signal, the original fLO, and the two new frequencies fd+fLO and fd-fLO. The output signal also generally contains a number of undesirable mixtures as well. (These are 3rd- and higher-order intermodulation products. If the mixing were performed as a pure, ideal multiplication, the original fd and fLO would also not appear; in practice they do appear because mixing is done by a nonlinear process that only approximates true ideal multiplication.)

The amplifier portion of the system is tuned to be highly selective at a single frequency, fIF. By changing fLO, the resulting fd-fLO (or fd +fLO) signal can be tuned to the amplifier's fIF. In typical amplitude modulation ("AM radio" in the U.S., or MW) receivers, that frequency is 455 kHz; for FM receivers, it is usually 10.7 MHz; for television, 45 MHz. Other signals from the mixed output of the heterodyne are filtered out by the amplifier.

[edit] Design and its evolution

The diagram below shows the basic elements of a single conversion superhet receiver. The essential elements of a local oscillator and a mixer followed by a fixed-tuned filter and IF amplifier are common to all superhet circuits. Cost-optimized designs may use one active device for both local oscillator and mixer--this is sometimes called a "converter" stage. One such example is the pentagrid converter.

The advantage to this method is that most of the radio's signal path has to be sensitive to only a narrow range of frequencies. Only the front end (the part before the frequency converter stage) needs to be sensitive to a wide frequency range. For example, the front end might need to be sensitive to 1-30 MHz, while the rest of the radio might need to be sensitive only to 455 kHz, a typical IF. Only one or two tuned stages need to be adjusted to track over the tuning range of the receiver; all the intermediate-frequency stages operate at a fixed frequency which need not be adjusted.

To overcome obstacles such as image response, multiple IF stages are used, and in some case multiple stages with two IFs of different values. For example, the front end might be sensitive to 1-30 MHz, the first half of the radio to 5 MHz, and the last half to 50 kHz. Two frequency converters would be used, and the radio would be a "Double Conversion Super Heterodyne"--a common example is a television receiver where the audio information is obtained from a second stage of intermediate frequency conversion. Occasionally special-purpose receivers will use an intermediate frequency much higher than the signal, in order to obtain very high image rejection.

Superheterodyne receivers have superior characteristics to simpler receiver types in frequency stability and selectivity. They offer much better stability than Tuned radio frequency receivers (TRF) because a tuneable oscillator is more easily stabilized than a tuneable amplifier, especially with modern frequency synthesizer technology. IF filters can give much narrower passbands at the same Q factor than an equivalent RF filter. A fixed IF also allows the use of a crystal filter when exceptionally high selectivity is necessary. Regenerative and super-regenerative receivers offer better sensitivity than a TRF receiver, but suffer from stability and selectivity problems.

In the case of modern television receivers, no other technique was able to produce the precise bandpass characteristic needed for vestigial sideband reception, first used with the original NTSC system introduced in 1941. This originally involved a complex collection of tuneable inductors which needed careful adjustment, but since the early 1980s these have been replaced with precision electromechanical surface acoustic wave (SAW) filters. Fabricated by precision laser milling techniques, SAW filters are much cheaper to produce, can be made to extremely close tolerances, and are extremely stable in operation.

Microprocessor technology allows replacing the superheterodyne receiver design by a software defined radio architecture, where the IF processing after the initial IF filter is implemented in software. This technique is already in use in certain designs, such as very low cost FM radios incorporated into mobile phones where the necessary microprocessor is already present in the system.

Radio transmitters may also use a mixer stage to produce an output frequency, working more or less as the reverse of a superheterodyne receiver.

[edit] Drawbacks

Drawbacks to the superheterodyne receiver include interference from signal frequencies close to the intermediate frequency. To prevent this, IF frequencies are generally controlled by regulatory authorities, and this is the reason most receivers use common IFs. Examples are 455 kHz for AM radio, 10.7 MHz for FM, and 38.9 MHz (Europe) 45 MHz (US) for television.

(For AM radio, a variety of IFs have been used, but most of the Western World settled on 455kHz, in large part because of the almost universal transition to Japanese-made ceramic resonators which used the US standard of 455kHz. In more recent digitally tuned receivers, this was changed to 450kHz as this figure simplifies the design of the synthesizer circuitry).

Additionally, in urban environments with many strong signals, the signals from multiple transmitters may combine in the mixer stage to interfere with the desired signal.

[edit] High-side and low-side injection

The amount that a signal is down-shifted by the local oscillator depends on whether its frequency f is higher or lower than fLO. That is because its new frequency is |f - fLO| in either case. Therefore, there are potentially two signals that could both shift to the same fIF one at f = fLO + fIF and another at f = fLO - fIF. One or the other of those signals, called the image frequency, has to be filtered out prior to the mixer to avoid aliasing. When the upper one is filtered out, it is called high-side injection, because fLO is above the frequency of the received signal. The other case is called low-side injection. High-side injection also reverses the order of a signal's frequency components. Whether or not that actually changes the signal depends on whether it has spectral symmetry or not. The reversal can be undone later in the receiver, if necessary.

[edit] Image Frequency (fimage)

One major disadvantage to the superheterodyne receiver is the problem of image frequency. In heterodyne receivers, an image frequency is an undesired input frequency equal to the station frequency plus twice the intermediate frequency. The image frequency results in two stations being received at the same time, thus producing interference. Image frequencies can be eliminated by sufficient attenuation on the incoming signal by the RF amplifier filter of the superheterodyne receiver.

Early Autodyne receivers typically used IFs of only 150kHz or so, as it was difficult to maintain reliable oscillation if higher frequencies were used. As a consequence, most Autodyne receivers needed quite elaborate antenna tuning networks, often involving double-tuned coils, to avoid image interference. Later superhets used tubes especialy designed for oscillator/mixer use, which were able work reliably with much higher IFs, reducing th eproblem of image interference and so allowing simpler and cheaper aerial tuning circuitry.

[edit] Local oscillator radiation

It is difficult to keep stray radiation from the local oscillator below the level that a nearby receiver can detect. This means that there can be mutual interference in the operation of two or more superheterodyne receivers in close proximity. In espionage, oscillator radiation gives a means to detect a covert receiver and its operating frequency.

Further information: Electromagnetic compatibility

[edit] Local oscillator sideband noise

Local oscillators typically generate a single frequency signal that has negligible amplitude modulation but some random phase modulation. Either of these impurities spreads some of the signal's energy into sideband frequencies. That causes a corresponding widening of the receiver's frequency response, which would defeat the aim to make a very narrow bandwidth receiver such as to receive low-rate digital signals. Care needs to be taken to minimize osicllator phase noise, usually by ensuring that the oscillator never enters a non-linear mode.

The best Wikipedia articles are often filled with good checkable references, but other times it sounds like they were written in a foreign language and translated into English and have few (if any) good references.

Just because a Wikipedia entry isn't well-written or sounds awkward doesn't mean it's wrong, but I will often reject what I don't like in the poorly written ones.

Somewhere there's a bunch of people who spend their time correcting and improving Wikipedia entries, and I think overall they are doing a good job, but that doesn't mean the result is always devoted to my interests. Just like anything else in this world, it's got workers and it's got managers and they aren't always devoting their attention to the little corners of arcania that I live in.

It's not that the Encyclopedia Britannica is perfect either. I can open it up to the very few subjects that I happen to be expert on and find over-simplifications and a lack of cites to what I consider to be the best references. That doesn't mean it's out-and-out wrong, just that it's an Encyclopedia, and by definition they can't do anything but touch on the surface of all the interesting stuff in the world.

Of course in academia I got real used to opening a journal and instead of reading the articles, to go straight to the references and see if they are quoting one of my articles :-). Breadth vs specialization, can't pick them both.

Tim.

The best Wikipedia articles are often filled with good checkable references, but other times it sounds like they were written in a foreign language and translated into English

** Only indicates your lack of comprehension.

Just because a Wikipedia entry isn't well-written or sounds awkward

** You are irrationally obsessed with style over content.

Mostly likely because you cannot comprehend the content.

Somewhere there's a bunch of people who spend their time correcting and improving Wikipedia entries, and I think overall they are doing a good job, but that doesn't mean the result is always devoted to my interests.

** What a revolting, pompous little narcissist you are - Tim.

Just like anything else in this world, it's got workers and it's got managers and they aren't always devoting their attention to the little corners of arcania that I live in.

** I was much too kind earlier ....

It's not that the Encyclopedia Britannica is perfect either. I can open it up to the very few subjects that I happen to be expert on and find over-simplifications and a lack of cites to what I consider to be the best references.

** Mere narcissism has just turned into full blown ego-mania.

Of course in academia I got real used to opening a journal and instead of reading the articles, to go straight to the references and see if they are quoting one of my articles :-).

** Wot a nauseating computer geek puke.

......   Phil

A 180 Kbyte article about a technology developed in the 1910's, yet the oldest reference is to a textbook from 1996 aimed at freshman or sophomore EE students of the 90's. More original references would have gone a long way, especially to the patents and journals of the 1910's and 1920's.

Don't get me wrong, it's a kinda nice textbook that they reference, as I realize that by the 90's many EE programs had been so entirely taken over by VLSI and CAD techniques and the particular textbook fills a very important niche in education. It isn't the textbook that I learned about radio from but I see how it fits the modern times well. (I prefer Terman or Clarke&Hess but those guys weren't around in 1918 either.).

A smaller point, is that the language sounds a lot like it was written in a language other than English and then translated. In principle this isn't fundamentally bad, it's just that a lot of the terminology used sounds very awkward. I think that's fine if they reference 80 year old patents using the same language, but they don't.

Tim.

There's a thin line between ignorance and arrogance, Phil. I have
erased that line.

I had all the Boy's Books, I bought them from a local library for $.50
a piece. unfortunately they were all lost along with 50s and 60s ARRL
handbooks when my rental storage got brooken into.

Hey OM

The reason you see those high noise figures: Carbon comp resistors
being used in tube circuits. The gain of the preamp amplifies the
noise of the carbon comp resistors. Best is to use metal film
resistors much lower noise.
And squeezing 20db out of a 6cw4 that has only gain of around 64 or
about 14 db is quite the feat.

Not a pick of a fight, I am not that kind of guy. Has in part to do with
my other affiliation (church). I just found it a bit strange when you
blasted the ARRL and at the end in the sig line listed IEEE as a
professional organization. Which I do not see quite that way.

Not a pet way. All I wanted to do is show the pitfalls because newer hobbysits need to be aware of those. For high-powered stuff I also use relays, just as you do.

I wish it was professional all the way, not just partly. The last FAP mailer from them with the "professionality" level of a credit card solicitation came Friday. Well, at least it was useful to start the wood stove ;-)

> ... I regard
> myself as a "professional" for the simple reason of getting paid for

> different techniques could apply themselves to hobby activities and sometimes hobby experiments were useful in professional work. There never has been a clear-cut demarkation line of technology between avocational activies and occupational activities except as forced by certain groups within the overall activity.
>

That's a great career, when you can bring hobby experience into professional work. Same here, but only about 25 years pro work experience since my degree. Lots of homebrew electronics before that. However, I don't see this kind of cross-fertilization between hobby and professional life happen much in the next generation :-(

> You will notice a "callsign" in my signature, that of an Amateur Extra class callsign group assigned by the FCC. I did not bother with getting my first-ever amateur radio license until some time in January 2007 and then to pass all test elements on one Sunday afternoon on 25 February 2007. I did that for two reasons: I was able to do it (and had the chutzpah to do so); it was a convenience to have the least restrictions on operation in what MIGHT have been an enjoyable pasttime in my retirement (I still work in electronics but only on my terms (therefore not often) and not in "regular hours." I run into the SAME sort of "I SHOULD have done it <so-and-so>" in nearly every field of endeavor where there are CERTAIN ways that things "MUST be done."
>
> In a burst of enthusiasm, I joined the ARRL immediately after getting my federal amateur radio license grant (one cannot be a voting member without that grant according to League rules). That was another mistake I made. That AMATEUR organization membership is expiring at the end of March and I am not renewing. As a hobbyist, that AMATEUR membership has offered me almost NOTHING in return.

Ok, can't speak to that because I was a member in the German club (DARC). But ARRL did one great thing for me: Very low cost books, full of very useful technical information. Lots of stuff and antennas were built with the help of ARRL books.

> I have voiced my opinion on that AMATEUR organization in OTHER forums, to the FCC on amateur radio regulations, and enought that I don't wish to go into it here. Despite having started in big time HF communications 56 years ago, long-time amateurs consider me a "newbie," a "beginner in radio" and that is disheartening, taking away much of my interest in ALL electronics.
>

I remember that, in Germany call signs were issued in alphanumeric order (like non-vanity license plates in most states here) and some hams had the tendency of prejudice. Newer call sign ... aha, rookie. Which just wasn't true in many cases.

> In other forums NOT on amateur radio, I have been negatively criticized for being a member of certain organizations that the "expert" critics champion or dislike. For example, the ACM. the first professional association about computing worldwide. NOW, I see complaints about BENEFITS packages of the IEEE not meeting with certain individual's approval. I am not a follower nor an approver of Benefits Packages, nor a spokesperson of any kind for of those. ...

Just my humble opinion: If an organization can't get commercial products like FAP straight they ought to dump them and not keep them to make a penny. It's unprofessional, no matter what organization. And PL insurance is not a benefit, it's a paid commercial product that numerous members direly need in this case. Note the other thing I mentioned, much more important: Member forums, has to do with learning, helping others, exactly what also happens in a hobby. It ain't rocket science to set that up yet they blew it. Like you were with ARRL I was twice just about to ditch my IEEE membership but didn't at the last minute. Haven't given up hope yet, but I've learned that one has to be rather loud in the IEEE to be heard. It seems there are strict hierarchies that slow things down a lot. It should not be that way.

> ... There is very little in ANY Benefits Package that is of "benefit" in ANY homebrew electronics hobby activity. I will emphasize HOMEBREW. Radio. Electronics.
>

Right. Once you are retired, or mostly retired in your case, and insured by Medicare none of that insurance stuff matters anymore. But it does matter to the majority of members who aren't there yet. My advice to them would be: If you can't offer it as a decent product, don't offer it at all. Just like I (and probably you) would not want to be engaged in an engineering project we didn't believe in.

> For all my time spent working with, or being hobbyist in, electronics, many and varied "experts" have TOLD me in no uncertain terms that "This is the way 'we' do it in <activity>." I MUST do it as those "experts" say. Sorry, but having been IN the activity for a long time and watching the technology CHANGE, to have NEW ways and components introduced since 1947, I have to throw that didactic insistence (indeed a polemical philosophy) in the dumpster. If someone finds/discovers/innovates something while engaged in hombrewing some radio or other electronics, something NOT normally done but still follows established laws of physics, then it should be, in my viewpoint, be presented for other hobbyists. In the spirit of that being a possible useful thing that others might be able to use in their hobby activity. It should NOT be given in

```
> terms of "look what *I* did" as some claim to "expertise."  It
> might be USEFUL to others in their hobby work.  I feel that anyone
> who wants to discuss matters totally different than a forum's
> intended sphere of interest go find the appropriate forum to vent.
>
> I've learned one more thing in Life here.  Do not indicate one's
> affiliation or pride or other personal feelings in a
> "signature" of a posting...others do not like that. ...

Should be ok to do that. But people will see it and might react to it ;-)

>                                                 ... No matter,
> my amateur radio license callsign can get my legal address.
>

Mine's DK9JK. Not active at all right now though. Once I retire I plan
to sit for the US license exam just like you did. Probably will start
back out on 15m and 40m, CW and SSB, and maybe some of the newer modes.

Yeah I used metal film on my preamp. I tossed all of my carbon
resistors a few years ago after I fixed a guitar amp for a friend and
he brought it back telling me how noisy it was. I traced the problem
back to the NOS(40 years) resistors I had used.

Like I said those were S meter db.  :))

 From vague memory I think Geloso used them a lot and got a little under
4dB out of those on 144MHz. In case anyone needs a datasheet:

A careful reading still implies that vendors should be suspious
of items made prior to 1985. That date is the crux of matter.
Vendors selling used post 1985 items would be free to assume they
are safe....

The lead content in ink would be very low, and only could poison you if
you ATE the book.  Any child who would read one of the Morgan books
would be old enough to no longer be chewing on books.

Of course such books shouldn't be thrown in landfill (and burning them
would be bad too as it would release the lead to the atmosphere!).

Its probably more likely they would eat it instead of reading it.

```

I am trying to remember the name of a radio book that was stolen from me years ago. It was a simple entry level book that had construction projects. It featured a series of valve transmitter each a little more complex and powerful than the next. A 1 valve 2 valve and a 3 valve tx that would put out 75 watts and used an 829B in the final in a push-pull configuration. It wasnt a large book and I remember the cover was black. Also stolen was a science project book that showed how to build cloud chambers, your own x- ray machine and a particle accelerator. I built the xray machiine and most of a siesmograph. I had put the siesmograph project on hold because I couldnt find some of the key parts.

Any choke that is not self resonant at 50MHz and has enough inductance
to give an impedance at least 10 times the plate load resistance will
work.  It, of course, must be able to handle the required voltage and
current.  The form can be ceramic, Teflon, or any material that does not
absorb RF at 50 MHz. An air wound choke will work too, but would have to
be wound with thick enough wire to be self supporting, and it might be
hard to meet the other requirements with this type of construction.

I once fixed my parents tv by replacing the yoke, and I more recently
fixed my wife's tv set by replacing the flyback (AND the horizontal
output transistor).  The first set was a tube type Zenith B&W 19"
portable.  The second was a Trinitron color portable.
I think you still can get replacement yokes, flybacks, and even CRT's
for recent tv's.  Good luck getting anything else!

I think the real challenge will come when one of those monstrous LCD TV
sets goes on the fritz and it's anything other than the backlight
inverter that died.

The backlight itself is actually part of the LCD panel in most cases,
so when that dies, you need to replace the panel, which means the tv is
toast.

Most of the other parts are low power, except for the panel drivers,
which themselves may be part of the panel!

Often you can get to that inverter. Then if you are lucky it's the two
transistors. If not it's usually the transformer and then the catalog
chase begins.

> Most of the other parts are low power, except for the panel drivers,
> which themselves may be part of the panel!

Got to be careful. I've designed a HV generator with CCFL transformers for a client last year. Guess who was the first one it bit?

The remainder of those TVs is often largely high integration. DSPs, special video chips, memory, FPGA, ASICs. Very hard to debug because they won't give you any technical documents, usually.

Good link and the references were appreciated though the discussion was a bit confusing.

So in other words to all those that have suspect items; err on the safe side and discard them safely so as to avoid any possible infractions and liabilities.

OK I made a coil per the instructions I mentioned and placed it in
parallell with a 50 ohm resistor and connected it to my antenna
analyzer. There is a big spike in the SWR at about 75 Mhz. I assume
this is the self resonant frequency of the coil. Is this far enough
away from 50Mhz to use as a plate choke?

That's half an octave away.  Good enough.
I would install the choke in the circuit and without applying power or
drive put a gird dip meter to the choke and double check for resonance
again.  IF resonance at 50 mhz is detected, swing the tank capacitors to
make sure you are just detecting resonance in the tank circuit coupled
through the choke.  If that is what you see, it's OK.

Thanks, I was just trrying to finish up a project I started years ago,
my wife had been getting on to me about not completing what I start.
Tinkering with the nuvistors also sounded like fun. Well I now realize
why you dont see projects based on them and noone is scouring the
tables at the hamfest looking for nuvistors. There are better/easier
of ways  of skinning this cat. A DC to Daylight preamp using a MMIC
may well have better NF and gain.

Jimmie

Somehow this sounds quite familiar :-)

True, but tubes and even those tiny ones do have one distinct advantage. When a thunderstorm rolls through town or you accidentally transmit into your pre-amp their chance of survival is orders of magnitude higher. Just imagine, when placing a hard 50V spike onto the grid a tube won't even flinch. A GaAs-FET or MMIC? Tsssk ... *BANG*.

I realized this early on after getting my license. The transistor in the pre-amp on the roof had died for the umpteenth time during a thunderstorm. But this time the moss on the roof was quite thick and I almost slid down. Whew! That did it. Built one with a tube (army surplus, NOS, long lifetime version), and it never died again. Oh yeah, and more than once did I accidentally transmit into the back of it. Left it completely unfazed. Losing a dB or two in noise figure for the sake of not having to scale that roof was well worth it :-)

I have seen Russians offer cartons full of nuvistors on auction sites, they almost look like bonbon boxes. They must have a sizeable stash of those over there.

Quote "If that child were to actually start mouthing the book ..."

What has society come to? Where's the parents? In my youth parents or grandparents would read to the children. Leaving a very small child alone with a book would have been considered rather daft.

Maybe the next ARRL Handbook will contain a bold warning "Do not put in mouth" in English, Spanish and Klingon ;-)

According to this page
http://www.amsat.org/amsat/archive/amsat-bb/200409/msg00451.html
Geloso got 3.6 dB@50/144 MHz to 6.0 dB@432 MHz.

The VHF numbers are still usable at terrestrial VHF communication due
to the high band noise. For satellite and EME communication, the
performance it not very good at VHF and practically useless on UHF.

Most part of the lightning electromagnetic radiation is at quite low
frequencies (below 1 MHz) and a typical VHF/UHF antenna will have a
quite low effective height at such low frequencies, thus not much low
frequency energy should enter the preamp.

However, during thunderstorms, quite large static charges can be
accumulated in ungrounded antenna elements and if there is a DC path

to the transistor, there is a significant risk of damage.

Using a folded dipole and grounding the center point will reduce the static build up. The folded dipole will also act as a very small magnetic loop, reducing the LF pickup of the lightning EM pulse. A strong DC path (such as a shorted 1/4 wavelength stub) from the amplifier input to ground will also reduce the DC and low frequency pickup, thus reducing the risk for dangerously large voltages at the transistor base/gate.

I remember a book from my youth which sounds like the one you may be
thinking of , it was called something like "The Scientific American Book of
Projects and Experiments"

Theo

Although back in those days UHF was reserved for the more well-heeled
hams. I thought the 2m performance that old John got out of the
nuvistors was pretty good.

The trouble in my case was that this thing was also used for the upper shortwave bands, when doing duplex transmissions. Similar to what is nowadays called an active antenna. I didn't have the space for a 2nd large antenna, the first one was already quite a stretch. This was in Germany where properties are quite tiny.

SILENCED HAMS MEAN SAFER COUNTY

-from the Los Angeles Press-Telegram (4/1/2009)

San Luis Obispo county supervisors took drastic and unprecedented action yesterday by passing an ordinance that would prohibit amateur radio operators, known as "hams", from operating their transmitting stations. The measure was put in place to eliminate what officials said were health risks associated with transmitters located close to children. A legal struggle is expected.

By a vote of 4 to 1 with one abstention, the governing board of SLO county took action aimed at addressing a recent Stanford University study that showed a correlation between ham radios and attention deficit disorder and hyperactivity in children, as well as nagging reports of interference caused by radio hams operating their high-powered transmitters in residential neighborhoods.

"Our primary responsibility is to provide a safe environment for children to live without the dangerous effects of radio waves constantly bombarding them and causing proven neurological and psychological problems," said E. Duane Nyborg, an attorney who represented the county in several court cases in the past year. "Hams are not the only culprits, but they are usually in very close proximity to children and are no doubt a major contributor to the health problems we've been seeing. The interference is just the last straw that convinced the county that something had to be done about it."

Atascadero city manager Laura Lopez said that she has seen a tenfold increase in the number of complaints of interference from ham radio operators in the last six months. New housing developments which have dramatically increased the population there and placed homes unusually close to each other are the predominant contributing factor. Similar conditions exist in most of the county.

"We have radio hams getting into toasters, electric pianos, light bulbs, everything, from their powerful transmitters that cause all this static. Many of our citizens can't use basic appliances or watch television because of all the junk that the hams are broadcasting," she told the Press-Telegram by telephone.

Hams can't say they didn't see this coming. They were warned by the county last year that if they did not submit to a check of their stations by officials, they would have limits imposed on their operation. Few consented to the searches, which most decried as invasive. But nobody expected a total ban on transmissions.

"This is outrageous. You'd better believe we're going to fight back and win. This is a totalitarian seizure of our rights that is totally illegal and can't stand up," said Frank Wilson, a local ham club president. He said there were no formal plans for an appeal yet but preparations were underway.

Wilson claims that a federal preemption of local zoning ordinances, called PRB-1, delineates three rules for local municipalities to follow in accomodating antenna structures such as are used by hams. But Nyborg says that PRB-1 applies to antenna structures only, and not the transmitters used to feed the antennas with a radio signal. "We know all about PRB-1. That's why we said nothing about antennas. This law is not about antennas. It goes after the root of the problem, which is the transmitters that put out huge signals that get into the brains of our children and short-circuit them out. Those are the facts, that's what the scientific evidence points to," he said at a news conference called shortly after the county's action.

In 2008, a group of researchers in the school of Environmental Health and Safety at Stanford published their findings that exposure to ham radio signals for three hours per day increased the risk of hyperactivity and related disorders by 10% in children aged 12 and under. This effect was seen when a typical ham radio was turned on up to � mile away. The San Luis Obispo city office says that up to 11,000 children in that city live that close to a ham radio station.

The Stanford study showed that frequencies around 3.5, 7, and 14 Megahertz were the most harmful, but that the danger existed all the way up to 450 Megahertz and above.

"We know where the hams are, that information is easy to get on the Internet," said former mayor of Paso Robles and current county supervisor Anthony Wu. "Most of these guys are running one hundred watts of power, that's an incredible amount of radiation, and you can't block it out. It enters your house, it gets into your body and does a lot of damage there."

Cindy MacMahon, 41, of Morro Bay, soccer mom of two and volunteer at city bake sales, praised the action by the board of supervisors and looked forward to radio-free days ahead. "I'm always getting interference on my TV and stereo that I'm sure is from the guy down the street with his big tower. I don't know why they even allow those big, ugly things. I know that my kids are harder to control when he turns that thing on and I've been saying that for three years."

Most area hams were totally unaware of the new law and Wilson believes there will be a revolt when they discover it. "I will be speaking about it at our club meeting on Friday. We would normally disseminate the information by radio, but of course that's illegal for the moment."

Amateur radio operator Clay Collins of Pismo Beach, was incredulous. "We provide free emergency communications for the county, we assist the police department, we help out several times a year on all manner of public events, and this is the thanks we get. Someone is badly informed. Next thing you know, we'll be accused of being responsible for global warming." Another radio ham who identified himself only as "Deke" said that although a number of hams were mobilizing to do what they could he was pessimistic. "I actually know that Nyborg guy. He walks around twelve hours a day with a cell phone up to his head and yet he's worried about the tiny amount of radiation from my transmitter." Deke claims that the frequencies of a cell phone are close to that of a microwave oven. "You hold a [cell] phone up to your head, you're cooking your brain slowly," he warned.

Collins, a ham of fifty-three years and grandfather of six, lives in a housing tract with a homeowners' association that already regulates ham radio operators. He says that restrictive HOA agreements exacerbate the problem. "By prohibiting high antenna towers, [the HOA rules] force me to place my antennas lower and closer to my neighbors, and force me to use higher power to make up for the difference in performance." He said that his antenna, which is located in his attic, creates far more radiation on the ground than if it were up on a 50-foot tower-the same type of tower Collins applied for in 1997 but was denied a permit for. Hams are required by the FCC to keep track of the amount of radiation from their antennas but Collins' station is far below the allowable limits, he says. "In the next earthquake, all of my neighbors will be running to my house to send messages out to their loved ones in other places. I hope they remember this."

Dick Henley, a member of the Electronic Industries Association who lives in Ann Arbor, Michigan, claims that most of the interference to appliances, televisions, and phones can't be blamed on hams going about their normal activity. "The vast majority of these appliances is insufficiently shielded against external fields. The slightest interference- even from a garage door opener or a cell phone-can disrupt it. In most cases, it's not the ham's fault." He said that on the contrary, hams are usually the ones who must suffer with interference from these electronic devices. "Most of the stuff coming out of China spews interference to radios, but the hams have just learned to live with it. Homeowners are totally oblivious to this," he said.

Xiang Qang, the principal investigator at Stanford who co-published the original paper, explained that the radio waves, over the long term, polarize cells in the brain tissue and bias a child toward rough or anti-social behavior. "We saw these children who couldn't sit still, couldn't listen to a book being read to them, and who had severe reading delays and disabilities. We started to see that each time a television was turned on near them, they would actually exhibit worse behavior. So we followed that path: why the television? Why the television? Then we discovered that is wasn't the television, but the radiation from it. So we tested many other types of transmitters and found that the worst ones were ham transmitters from Icom and Yaesu, with the Kenwoods being marginally better."

Qang explains that it is the brain's frontal lobe which is most vulnerable to external radiation due to its location at the front of the cranium just behind the forehead, its proximity to the sphenoid wing- the bone at the temple that houses the pituitary gland- and it's large size. "The frontal lobe absorbs a lot of radiation and since it governs our behavior, this is why we think that attention deficit and hyperactivity are the symptoms of prolonged absorption of high-frequency waves in that region," she said.

"Nonsense," says Dr. V. Subrahaminayalakshminirayana, head of neurology at Kaiser Permanente in San Francisco. "There is absolutely no conclusive evidence in the literature to support an ambitious and imaginative theory that ionizing radiation can deleteriously and negatively affect behavior in children whether the exposure is at a relatively constant low-level or periodic." He believes that attention deficit hyperactivity is more likely a function of exhaustive over-stimulation of the brain by video games, texting, and television viewing. "Ask the Asian parents of your child's playmate why they never seem to have this problem," he laughed.

In fact, the Stanford study found that Hispanic children were fourteen times as likely to suffer the effects of radio waves than were Asian children. Hydra Brock-Parker, dean of sociology at Cal Poly San Luis Obispo and a consultant named in the Stanford study, says that Hispanics live in depressed parts of a city where houses and apartments are packed closer together and the possibility of exposure is much greater. "Where are all of those children going to go to escape radiation from transmitters? There's no backyard to play in and besides, you wouldn't want your children playing outside in those neighborhoods. If you've got, you know, a ham serial-killer type next door flooding your apartment with high-intensity radio waves, you have no choice but to sit there and get sick," she said.

Representatives from Marin, Ventura, and Los Angeles counties were present at the press conference and were said to be keenly interested in the implementation of the new law. A similar measure was introduced into the L.A. County Board's docket on Monday and may be considered at the next session in May.

lanews.com is a fake spam site

So how do you keep April fools jokes from being picked up by wackos that quote it as gospel and try to institute illegal measures in their own jurisdiction to drag people down by forcing them to defend themselves at great cost or default, like they tried to do in Lancaster.

Quit picking on ham radio.

Instead, lets tell the one where the leader decides a small but identifiable group is to blame for all the ills of the world and should be outlawed, forced to labor and finally exterminated. Oh wait! That really happened!

OH, what the heck,Since I got the preamp stage built I might as well build a 2M to 10M rx converter.

Jimmie

Reminds one of an outburst of complaints about interferenec to to TV
from one UK radio amateur station back in the 1950s.
While Britain had some TV back in 1937 the 1950s saw a fast growing
increase in domestic TV set ownership; quickly nicknamed 'The Telly'.
The interference complaints bubble burst rather rapidly when it turned
out the amateur in question, ad all his family, had been away from
home for the entire period of the complaints!

I have a Systron Donner frequency counter that uses Nixie tubes. The
counter works fine but I am forever replacing the Nixie drivers
74141s. I started to use it this AM an one was out. Is there a
replacement for the 74141, I couldnt find one, or is there a circuit I
could build on a DIP header to replace them. I could probably design
one but I wanted something tried an tested as I dont want to put my
counter board at more risk than I have to.

Jimmie

You might try reducing the current to the nixies by adding some series
resistance.  Those 74141s are going to get hard to get.  I made a
clock with nixies in the early 70's and it is still working fine.

RE- google: And your point is?

Although the main newspaper in LA (City) is the Times, there is a newspaper in LA County called the Press-Telegram. It's in Long Beach.

The date of the article is conclusive; the name of the alleged newspaper is NOT - it's a common mistake. The LBPT does have some readership in LA. It's one of the County's major regional papers.

Yeah, a handful of MPSA42.

If you find a reliable source of 74141, I'm in for some too.

Cheers!

The 7441 appears to be pin-for-pin compatible, but with a different decode pattern (one element is always on). It sounds like you might first want to check the nixie power supply voltage, not just using a voltmeter, but with a scope to see if it has spikes which might be destroying your driver outputs. This is much more likely if the counter is using leading zero suppression and the failed drivers are in the group which often in the blanked state.

It is.
If it were real, it would be the first law I'd break, then after
being arrested take the bastards to federal court, sue, win a gazillion
dollars and retire.

The chips are failing for one of two reasons, over voltage or over current. Try reducing the supply voltage to the minimum that will light the nixies. Also try heatsinking the 74141's. They do make clip on heatsinks for dip packages, but you can just superglue scraps of aluminum to the top of the chips.

This has been a problem on two different Systron Donner counters I own
and one we used at work years ago. It was such a regular thing at work
we added sockets to facilitate replacing the chips. I have done
likewise to mine but only as the chips failed. There are still a
couple of origonal chips in it. Mycounters are model 6153. I have
never had a schematic or manual for them and
This makes maintaining them a little difficult but having two of them
helps allowing me to compare signals and swap boards to help isolate
problems. If anyone has a schematic I would greatly appreciate it.

Jimmie

I guess CPSC isn't stopping with books... now its all terrain vehicles!

It seems that CPSC is using lead as a method of legislating anything 'they' don't want out of existence by claiming that it is unsafe for childeren. I don't see this trend stopping anytime soon---it will be interesting to see whats next.

I have been requested to test some of those Cordless Telephones that are so popular today.
However, We have a Computerized Phone System and can not get to an outside line to get the 50V and Dial Tone to test the incoming rings OR to test it's outgoing operation.

Does anyone (1) Have or know of a device that I could buy or (2) Information & Schematic so I could construct such a device myself.

Tnx for all comments...... 73...Norm VE3CZI   www.rodemi.com

Linksys PAP2 or any one of the hundreds of other devices?

If you are not into SIP, you can get one that connects via USB to a computer
and is driven by SKYPE.

Geoff.

>> SILENCED HAMS MEAN SAFER COUNTY
>

Gentlemen and Ladies;

Let's not forget that this story is purported to occur in the Peoples Democratic Republic of California. There was a City Council out there that recently tried to ban the possession of DiHydrogen MonoOxide as a deadly and extremely hazardous substance. The measure almost passed when someone noticed that the chemical formula was H20.....

Anything can happen out there in the land of fruits and nuts. (with apologizes to my relatives in San Diego.

Yes, maybe this suits your needs:

http://www.digitalproductsco.com/

It's a friend of mine. But remember, this is for the phone standard used
in the continental US. I don't know if Canada is the same.

Hi there,
this is my first post here, hope not being off topic :)
I was asking myself if there were resources over the net that cover the
development of a cassegrain antenna [from the design up to the building]
in a homebrew fashion.

Thank you for paying attention towards this mail :)

Bye bye

See that red dot that says "false"?

Confusing language and the law of unintended consequences is the
problem, no vast conspiracy to deprive people of their old books or kids
clothing. So it's been delayed. Maybe we can now go back to chemtrails
or something......

After all the Off Topic postings on lead in childrens books and cordless
phone tests equipment, yours is the first truly On Topic post I've seen
in quite some time!  Thank you!!  :-)

But, alas, I can give you no advice on your search for cassegrain
antenna design.

Regards,
Jonesy

you might try w1ghz I believe he has some stuff(spreadsheet) to
calculate params for a cas.
you might also look into optical design software a cas is the same
just the wavelength is longer in the one you are probably thinking of.

good luck

Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

> calculate params for a cas.

Yep, I saw. :)

> you might also look into optical design software a cas is the same
> just the wavelength is longer in the one you are probably thinking of.

Could you explain which software do you mean? For optical design do you
mean optical cas telescope or optical geometry approximation?

Thank you again!

I'm finally admitting there are some interesting aspects
of radio that I'm not going to live long enough to get around to, so
I'll send the following to the first technically-oriented person who
agrees to pay $10 for postage (inside the USA) and my trip to the
Post Office:

The low and medium frequency radio scrap book
Addendum '77/'78 for thr low and medium radio....
  both "From the Editors of ham radio/
           Ken Cornell, W2IMB"

A collection of articles and writings about antennas, receivers,
loops, coils, and coil winding for getting on the VLF "lowfer" band.
Mostly tube gear with transistor gear mostly in the supplements.
About 180 8.5 x 11 pages, 3-hole-punched loose-leaf with heavy paper
covers.

Email W0PBV@ARRL.net if you want them.

Is there a replacement for the 74141, I couldnt find one, or is there a circuit I could build on a DIP header to replace them. I could probably design one but I wanted something tried an tested as I dont want to put my counter board at more risk than I have to.

Domestic 74141's are hard to find these days but on E-bay the Russian equivalent is very common.

Yes, you could build just about anything with a one-of-ten decoder and some current-sink drivers to do the same.

If the goal isn't nixie tubes but is a working frequency counter, you could probably put the counter up on E-bay for somebody who wants nixie tubes, and use the money to buy several superior frequency counters.

I forgot that the 74141 was also a decoder chip. I was thinking it was
just a driver. That complicates things a bit.
As far as the quality of the counter goes it works just fine and I
still have a few 74141s though my supply is getting low. I may try
```

some of the Russian chips.

As I noted in a previous email, the 74141 is still available, but
looking at Mouser, I see they are not exactly cheap...but...it beats
hacking up a piece of equipment and trying to use a completely different
part...here's the link to Mouser's part...

http://www.mouser.com/Search/Refine.aspx?Keyword=nte74141

It appears they still make the 74141. Here's a list of suppliers
according to NTE...

Anyone know of a source for semi rigid coax in general and RG-401 in
particular in hobby quantities like 3 to 6 feet?

I can find lots of places willing to sell me a 50 foot spool.

I have seen some of the surplus places have it from time to time.
Sometimes a phone call to them will get you things they dont have in
their catalog.

Have you tried asking manufacturers like Micro-Coax who their stocking
distributors are?  One of the distributors may take pity on you and
sell you a small quantity.  You _might_ even be able to sweet-talk a
manufacturer/rep out of a sample of 3 feet of the stuff.

Cheers,
Tom

Almost all the distributors are willing to sell short lengths with
an added flat, short length, cutting fee ranging from $15 to $25,
which at the price of this stuff may be the way to go.

I have questions like:

* The 3586 manual says in one place that the frequency increase/decrease buttons do not function in the remote mode. In the chart of commands, it says that the GPIB command for increase is UP and the GPIB command for decrease is DN. Does anyone know whether these are valid commands or not?

* Can anyone provide a step-by-step procedure for the command sequence to read the 3586 signal magnitude using GPIB?

* Which GPIB adaptor do you use?

Many thanks.

Cheers,
John - KD5YI

If this keeps going on and becomes a money pit without a bottom there is
still the unthinkable: Hack the counter and put 7-segment LED displays
in it. Ok, all that nice Nixie-ambience will be lost but you can apply
those $7-8 per 74141 towards a more worthy cause, like a nice six-pack
of fine porter or pale ale :-)

To maintain somewhat of a vintage look: For a brief time period there
were 7-segment displays with small filaments in there. But could be
tough to find in surplus store and usually you have to buy the equipment
around them along with the display. Another nice option (if there is
enough space depth-wise) were displays with individual lamps and number
lenses. Those look really cool.

Also helpful could be to use a DSO and scope out what happens when the
counter gets turned on and off, and when the numbers are changing
wildly. Maybe some electrolytic cap has dried out and an overvoltage

spike shows up only the Nixie supply rail, occasionally frying a driver.
Ground contacts in the driver board area are also worth to be checked out.

Use the 74141 (or a 7441 I think is the lv version of the 1 out of 10
decoder) to drive HV NPN transistors. The 2n5400/5401 pnp and
2n5550/2n5551 npn are dirt cheap 120/150 volt transistors that could be
used.

No idea, but why not just try it out? In case you don't have all the manuals they can be found here, scroll down about 40%:

http://www.w5jgv.com/amateur_radio.htm

> * Which GPIB adaptor do you use?
>

The Prologix USB. Works fine (after finding a level threshold bug and the designer made new firmware for it).

Hi, Joerg -

I was using a Softmark USB-GPIB unit. Although they responded to commands, I spent about 20 hours trying to get a reply other than gibberish from three different instruments with no success. I may have to roll my own controller, but first I have to understand GPIB.

Thanks for the link, but I already have the manuals. It is the operator's manual that I referred to above when I pointed out what I think is a contradiction.

73,
John

I manage to get a dozen chips for $.50 a piece form a mom/pop place I
buy parts from. I bought the last they had and probably ever will
have.. If  I could find a schematic on the thing I would see what I
could do about reducing the voltage. Im afraid to do too much
experimenting with the thing because its a good counter with at least
some sentimental value I dont want to risk damaging it. The back of
the counter has a connector with BCD output I guess I could always
build a display to work from there.

Systron Donner 6153 if there is a schematic available.

Jimmie

As the sunspot cycle is inching forward, I've been considering adding an upconverter to Charles Kitchin's 50MHz audio-squelched superregen design, in order to make a sensitive and very quickly tuneable 15-30MHz receiver intended to take the pulse of propagation on the higher HF bands. The idea came from an unpretentious Russian design. (No, it wasn't a fremodyne).

In a classic case of mission creep, I observed that a fixed IF lends itself to a further step. I searched for prior art in inducing super-regeneration in a resonant cavity.

If that could help narrowing the passband, it would be a nice trick for upconversion.

I found few and laconic references at almost-otherwordly microwave frequencies, Gunn diodes, folded spectra, etc etc.

If I could make a resonant cavity in no time I'd not ask for advice before jumping in, but this would be my very first, and shooting for 40-60Mz IF it risks being somewhat monumental - short of pigtailing the resonator, or doing a folded design, or some other "Grande Complication" which might negate the very idea of using a cavity.

******   Prior art pointers, anyone?   ******

TIA

Filippo N1JPR

P.S.: Just to prempt repetitions of the obvious I'll repeat it myself:
Why don't you use a [superhet =A6 xtal roofing filter =A6 downconversion =A6 cod liver oil =A6 snake oil]. Sorry I never heard of it, so it's likely to be a bad idea. Are you a Communist? Never heard of a 40MHz cavity. A superregen won't demod [CW =A6 SSB =A6 [QM=A6P]SKxx =A6 delta-sigma =A6 ancient Greek] ! Is this gonna be a portable receiver in that you can put it in the back of a SUV - if someone helps you carry the 6' long cavity, that is? You will need a [BFO =A6 product detector =A6 AMS =A6 DSP =A6 LPF =A6 postprocessing =A6 Photoshop]. IF passband wi=
ll be
too broad, although I have no idea how broad since I never used a cavity for that. :-o

"Coaxial Line V.H.F. Receivers", Joseph Santangelo, W1NXY, QST, March 1948, volume XXXII, number 3.

Basically it was a superregen using a coaxial cavity to increase the Q. Reported sizes were 7.5" x 2" for the outer conductor, 7.5" by 0.5" for the inner. The author's version was silver plated, but he reported that aluminum and copper had been used. He loaded it with a cap to get the right frequency.

It didn't look too hard to build, but its going to have to grow for 6m. You _ought_ to be able to do this with CATV hardline if you don't mind lots of connectors at the bends or a really long, skinny radio. You _may_ be able to get a decent Q just using some really efficient flexible coax, coiled up. I'd even see if I could find some semi-hardline that I could bend into a serpentine shape, were I playing with this notion.

Does anyone have a copy of CQ magazine for November 1951 please?
The issue contains a construction article - the "Standard of Comparison" receiver.
If anyone can supply a high definition copy of this article, or know of an alternative source, I would be extremely grateful.

Theo

I know a guy that built a stripline output circuit for a 6M amp.I think it was about 4 ft long.

That's what I had at first as well, just gibberish. Turned out the logic
threshold is way too high in the Prologix. Engaging the internal
pull-ups of the uC in there did the trick.

Is there any particular plug/socket type connector that is an accepted standard or most prevalent kind for connecting a CW key to a radio?

All my older rigs use a 1/4" audio connector, like a mono microphone. I tend to use 1/8" connectors, for space reasons.

Really old rigs used all sorts of things, often binding posts or tip jacks.

And if the rig has a built-in keyer, usually of the three-circuit
variety.

I'm glad you got them to fix it because I ordered a Prologix one yesterday.
I think I should have gotten the Prologix to begin with because I need to
write my own software to do things and the Softmark was not set up for that.

73,
John

I think it's the APN141 that uses a gated regen with a cavity.  You
might get some interesting ideas from it, if you can find any
documentation on it.  It's a cute design that made me think "out of
the box" when I learned it many years ago.

You're talking about a low enough frequency that you'll probably
benefit from a calculation of the size of resonator you'll need to get
the same Q as you can get from an LC tank.  I suspect that unless you
are willing to make a really big coaxial resonator, you'll be able to
do better with an LC tank, or equivalently a helical resonator.  At
1GHz and above, a cavity or coaxial resonator usually makes a lot of
sense.  At 1MHz, a cavity or coaxial resonator probably never makes
sense.  At 50MHz---well, do some careful thinking about it before you
jump in.  A coil a couple inches in diameter and two to four inches
long should get you to Qu well in excess of 1000, if you are careful
with the construction.

Cheers,
Tom

IIRC N1TEV's design used a sine wave waveform in the quench
oscillator.  As such the receiver is slope controlled, in which case
the bandwidth depends upon the rate of change of the admittance across
the tuned circuit as it goes into an oscillation condition, and not
the Q of the resonant circuit.

The standard reference is "Super-Regenerative Receivers", by J.R.
Whitehead, Cambridge University Press, 1950.

============================================
Most (older) radios have a 6.3 mm (1/4 inch) telephone jack socket
either 2 lead or 3 lead  (stereo model)  when having a built-in keyer.
I also have seen radios with for the Key  a RCA  audio socket .

Most are 1/4 or more recently 1/8 for straight keys with 3 circuit for
keyers.  It varies some.  I find it easier to keep the cord with the radio
and use insulated alligator clips and move the favorite key around.  This is
the tip for club stations and FD where people bring in their own key.

If you run into issues and think it's related to the Prologix design just write to the designer (Abdul). He is very responsive and actually the firmware you are getting with the new one will reflect the Vt change he and I found necessary. All others with older versions can just download the new firmware from the Prologix site.

I guess you've already found this site but just in case others here have not, this is a great tool set for GPIB:

Except for those of us with the first-generation Prologix product,
alas.  It has a different architecture, and (as far as I can tell) no
upgrade path available.

It works reasonably well with my Tek scope, as long as I'm careful
with the command sequences and don't ask the scope to send any data
back in binary mode.

I got it today and it works very well. I had it talking and listening to all
three of the GPIB-capable instruments I have in less than an hour.

Thanks for the link.

73,
John

Great! Yours is probably screaming-yellow, mine's the now ancient silver
version. I still have to make angles for the GPIB side from Digikey
connectors and some ribbon cable. The Prologix plus USB cable sticks out
too much towards the back, easy to crush when moving an older analyzer.

Initially I thought the OP was going to incorporate the very high Q
resonant circuit in his converter , to me that would be the logical
thing to do, then I re-read it. Of course you are correct. I can
greatly appreciate that the OP wants to do things his way just
because thats the way he wants to do it. Given the complexity of the
circuit he is going to eventually have I think he should just build a
little superhet for his purposes.

Jimmie

Further to my comment about how big a coaxial resonator must be to get high Q: to get Qu of 1000 at 50MHz will require an air-dielectric line almost 1.5 inches OD. A quarter wavelength is about 60 inches; you can shorten that some by loading the open end with capacitance, but expect it will be at least half that long. Compare that with a coil of 8 turns of #10 AWG copper wire 1.25 inches ID, spaced 2 wire diameters center-to-center (less than 2 inches total length) that will also give you a Qu over 1000.

I think if I had an overwhelming urge to try a design using a cavity (or coaxial cavity) resonator, I'd do it at about 1GHz, or maybe even 500MHz, where I can make a resonator with high Qu in a practical size, and where I can't wind a coil that's big enough to get really high Q and also have a high self resonant frequency. For example, at 1GHz, a quarter wave air dielectric cavity will be about 3 inches long, and if I make it from "3/4-inch" copper pipe (properly cleaned), I can get Qu well over 2000; it will be very tough to make a coil that has a self-resonance above 1GHz that has a Qu even close to 1000 (short of using superconducting wire!).

There are very practical reasons that you don't see cavity resonators at low frequencies: you can do better with smaller, cheaper parts.

Cheers,
Tom

Quarter inch phone plug is most common on equipment from the 50's,
60's, 70's. A few use a phono (RCA) plug.

A lot of recent equipment has an 1/8" stereo jack that allows you to
use an iambic paddle on the rig's built in keyer.

There have in the past few months been a couple of QST reviews of
paddles and portable paddles where, for some bizarre reason, the
reviewer assumed that a typical user was incapable of wiring the
connecting plug or correcting the wiring if left and right was
reversed. I thought this was a little odd, but maybe a lot of newbie
hams really cannot wire a plug. I will admit that the cheapie plugs
and jacks from Radio Shack, Mouser, etc., are pretty crappy and melt
the insulator if you are too heavy handed with a soldering gun. The
Switchcraft plugs and jacks (a lot more money than the cheap stuff!)
are a joy to work with.

Tim.

Which is not to say that Mouser ONLY carries "cheapie" plugs and jacks. They are a Deltron distributor, and Deltron makes some really fine parts. For one of their 1/4" phone plugs, see

http://www.dem-uk.com/DEM_PDFs/326.pdf. I've been using Deltron XLR
connectors for over 10 years, and find they are a real joy to assemble
and to use, and have held up extremely well in a professional audio
environment. The XLRs beat the Switchcrafts hands down, and I
personally like them better than Neutrik. But their over $10 each
price for 1/4" phone plugs probably isn't for everyone. ;-) (Mouser
also sells Switchcraft...)

Cheers,
Tom

FYI,

There is a sociological phenomenon called "Godwin's Law"

Here is a copy.....

Subject: How to post about Nazis and get away with it - the Godwin's Law FAQ

Archive-name: usenet/legends/godwin
Posting-Frequency: monthly
Last-Modified: October 7, 2003
Version: 1.15
URL: http://www.killfile.org/faqs/godwin.faq
Maintainer: tskirvin@killfile.org (Tim Skirvin)

Godwin's Law FAQ
-or-
"How to post about Nazis and get away with it"

One of the most famous pieces of Usenet trivia out there is "if you mention Hitler or Nazis in a post, you've automatically ended whatever discussion you were taking part in". Known as Godwin's Law, this rule of Usenet has a long and sordid history on the network - and is absolutely wrong. This FAQ is an attempt to set straight as much of the history and meaning of Godwin's Law as possible, and hopefully encourage users to invoke it a bit more sparingly. Of course, knowing Usenet, it won't do an ounce of good...

[Standard Disclaimers: this document assumes you have some basic knowledge of Usenet; if you don't, go check out news.announce.newusers for a while to gain said knowledge. Misuse of the information contained within this FAQ is not the responsibility of the author (though he's pretty confused exactly how you could misuse this information). Copyright 1999-2002, Tim Skirvin, all rights reserved, <FISH><, fnord, furrfu.]

I. The Basics

1. What is Godwin's Law?

Godwin's Law is a natural law of Usenet named after Mike Godwin (godwin@eff.org) concerning Usenet "discussions". It reads, according to the Jargon File:

> As a Usenet discussion grows longer, the probability of a comparison involving Nazis or Hitler approaches one.

2. What does it mean?

It pretty much means exactly what it says - as a Usenet thread goes on, the chances of somebody or something being compared to a Nazi approach one.

3. Yes, but what does it *mean*?

Aah, now *there's* the real question.

In case your head has been buried in the sand for the last sixty years or so, the Nazis were a German political party led by Adolf Hitler that slaughtered upwards of ten million people that didn't meet their standards of "ethnic purity" and set off to conquer Europe and the world in World War II. They are generally considered the most evil group of people to live in modern times, and to compare something or someone to them is usually considered the gravest insult imaginable.

As a Usenet discussion gets longer it tends to get more heated; as more heat enters the discussion, tensions get higher and people start to insult each other over anything they can think of. Godwin's Law merely notes that, eventually, those tensions eventually cause someone to find the worst insults that come to mind - which will almost always include a Nazi comparison.

4. That still doesn't answer my question. What does it *MEAN*?

The Law is generally used on Usenet as an indicator of whether a thread has gone on too long, who's playing fair and who's just slinging mud, and who finally gets to "win" the discussion. It has, over time, become the closest thing to an impartial moderator that Usenet can get.

So, what this means in practical terms:

- If someone brings up Nazis in general conversation when it wasn't necessary or germane without it necessarily being an insult, it's probably about time for the thread to end.
- If someone brings up Nazis in general conversation when it was vaguely related but is basically being used as an insult, the speaker can be considered to be flaming and not debating.
- If someone brings up Nazis in any conversation that has been going on too long for one of the parties, it can be used as a fair excuse to end the thread and declare victory for the other side.

5. So - *WHAT DOES IT MEAN*?

Fine, fine - it means that somebody's eventually going to say something about the Nazis in any thread that lasts very long. When it happens, the thread is going to start either degenerating into a long flamewar over Nazi Germany or about Godwin's Law. Either way, the thread is effectively over, and you can safely killfile the thread and move on.

II. What does it mean?

1. Didn't we already spend the last section talking about this?

Well, yeah, but people don't seem to get the point...

2. What happens if we're actually talking about Nazis?

Then you've already invoked Godwin's Law, and the chances are that your thread isn't going to last all that much longer as a sane discussion. Them's the breaks.

That isn't to say, of course, that you can't talk about Nazis and such on Usenet - this *is* Usenet, after all, where virtually every conversation that goes on is fairly ludicrous in the first place. It's just going to take you a lot more effort to find real information out of there and to avoid getting yourself off on side-threads - which you'll eventually do regardless, but you can try to put it off.

This also applies if a thread mutates into an actual discussion of Nazis, of course.

3. What about arguing with Neo-Nazis?

Arguing with Neo-Nazis is probably the quickest path to getting Nazi invocations, because, well, they're actually accurate. Still, trying to invoke Godwin's Law near a Neo-Nazi isn't really a good idea because it's not terribly original and they'll probably get off on it anyway. Just ignore them and occasionally publish a FAQ detailing what actually happened during the Holocaust and such; arguing probably isn't going to help you.

4. How can I use Godwin's Law to my advantage?

In the proper kind of flamewar, Godwin's Law can be used as a gambit - how can you force your opponent to invoke the Law? Actually teaching these skills is tough, of course, and is best done through experience. Experience with chess and alt.flame are recommended.

5. What should I do if somebody else invokes Godwin's Law?

The obvious response is to call them on it, say "thread's over", and declare victory. This is also one of the stupidest possible responses, because it involves believing far too much in the power of a few rules that don't say exactly what you wish they said anyway. The proper response to an invocation is probably to simply followup with a message saying "Oh. I'm a Nazi? Sure. Bye" and leave, and in most cases even that much of a post is unnecessary.

6. "Hitler!" Ha! The thread is over!

Nope, doesn't work that way. Not only is it wrong to say that a thread is over when Godwin's Law is invoked anyway (Usenet threads virtually always outlive their usefulness), but long ago a corollary to the Law was proposed and accepted by Taki "Quirk" Kogama (quirk@swcp.com):

> Quirk's Exception: Intentional invocation of this so-called
> "Nazi Clause" is ineffectual.

Sorry, folks. Nice try, though.

7. Does Godwin's Law apply in the real world?

Actually, yeah, but usually discussions in Real Life end by somebody wandering off in disgust before it can be invoked.

8. Are there any topics that lead directly to Godwin Invocations?

Well, yeah. Of course. Case's Corollary to the Law states "if the subject is Heinlein or homosexuality, the probability of a Hitler/Nazi comparison being made becomes equal to one" - but that's just an old list. Abortion and gun control debates always lead to Nazi comparisons; talk with a Libertarian for more than a few hours and he'll almost certainly bring up Nazis; book-burning is pretty much considered a sub-topic of Nazism at this point. Hell, talk about anything politically related and you'll eventually get there.

If you're really bored, a fun game to play is Six Degrees of Godwin. Take a topic - any topic - and see how quickly you can relate it to Nazis using legitimate topic drift methods. For example: a discussion about computers will eventually lead to discussions of keyboards and which are best, followed by a lot of complaining about the Windows key on 104-key keyboards, leading to complaints about Microsoft, forcing the standard MS-vs-government flamewar that I'm sure you're all aware of, leading to attacks on Microsoft's "fascist" tactics by one side or another, which will force the other side to start talking about the differences between fascism, capitalism, and, of course, Nazism! The fun never stops!

Appendix A: The Many Forms of Godwin's Law

"You can tell when a USENET discussion is getting old when one of the participants drags out Hitler and the Nazis."
- Richard Sexton (http://www.vrx.net/richard/) stating what would later be known as Godwin's Law, Message-ID <21000@gryphon.COM>, 16 Oct 1989

  http://groups.google.com/groups?selm=21000%40gryphon.COM&output=gplain

"Godwin's Rule of Nazi Analogies: As a Usenet discussion grows longer, the probability of a comparison involving Nazis or Hitler approaches one."
- Mike Godwin, first article about the topic in the Google archives, Message-ID <1991Aug18.215029.19421@eff.org>, 18 Aug 1991

  http://groups.google.com/groups?selm=1991Aug18.215029.19421%40eff.org

:Godwin's Law: /prov./ [Usenet] "As a Usenet discussion grows longer, the probability of a comparison involving Nazis or Hitler approaches one." There is a tradition in many groups that, once this occurs, that thread is over, and whoever mentioned the Nazis has automatically lost whatever argument was in progress. Godwin's Law thus practically guarantees the existence of an upper bound on thread length in those groups.
- The Jargon File (http://www.ccil.org/jargon/)

Hitler, Nazis, nazis, and net.cops:

Warning: now that this FAQ has mentioned Hitler and Nazis, UseNet Rule #4 (also known as Godwin's Rule, after Mike Godwin of the EFF, sci.crypt, and comp.org.eff.talk, a sometime foe of David Sternlight (q.v.) [even though it was apparently in use, by Richard Sexton {q.v.} among others, before Mike's 1988 (?) net.advent; the "Godwin's" part seems to stem from "Rich Rosen's Rules of Net.Debate, which I don't have a copy of]) says it will be coming to an irrelevant and off-topic end soon. Just as there will always be newbies ("It's *always* September, *somewhere* on the net" - response to a 1993 wave of delphi.com postings on a.f.u), there will always be people who see the net and are repulsed because there's stuff there they don't want to see - so they set out to make sure noone else can, either. They invariably fail, because there are no net.cops to enforce any such rules on UseNet; in the course of the heated flamewar that usually follows, things escalate until either Hitler or Nazis (or both) put in an appearance, at which point the thread has officially lost all relevance. People scream at each other a bit more, then give up and go home. Bleah. "Keep your brains up top; don't be a net.cop."

This has mutated, in true UseNet fashion, to encompass *any* continuing thread; if you mention Hitler or Nazis out of the blue, the thread is sure to die irrelevantly soon (and, incidentally, you've lost the argument, whatever it was)... and every continuing thread on UseNet *must* contain such a reference sooner or later. Invoking Rule #4 deliberately in hopes of ending a thread, however, is doomed to failure (Quirk's Exception)...

UseNet Rules #n:

No firm info at the present time is available on just what the other UseNet Rules #n are. However, at a guess, they include:

--

Rule #nonumber: There are no hard-and-fast Rules on UseNet, only Guidelines, which are more or less strictly enforced (and differ) from group to group; this is why it's generally wise to read any group for a bit before ever posting to it.

Rule #0: *There* *is* *no* *C*b*l*. There *is*, however, a net-wide conspiracy designed solely to lead Dave Hayes (q.v.) to believe that there is a C*b*l.

Corollary: *There* *are* *no* *pods*.

Rule #9: It's *always* September, *somewhere* on the Net.

Dave Fischer's Extension: 1993 was The Year September Never Ended [so far, there doesn't seem to be much evidence he's wrong...]

Rule #17: Go not to UseNet for counsel, for they will say both `No' and `Yes' and `Try another newsgroup'.

Rule #2 (John Gilmore): "The Net interprets censorship as damage and routes around it."

Rule #108 (from the soc.motss FAQ): "What will happen to me if I read soc.motss?" "In general, nothing. (You may be informed or infuriated, of course; but that's a standard Usenet hazard.)"

Rule #666: Old alt groups never die. They don't fade away nicely, either.

Rule #7-B: There is no topic so thoroughly covered that noone will ever bring it up again.

Rule #90120: Applying your standards to someone else's post *will* result in a flamewar.

Rule #1: Spellling and grammer counts. So do grace, wit, and a sense of humor (the latter two are different), as well as a willingness to meet odd people, but these are lesser considerations.

Rule #x^2: FAQs are asked frequently. Get used to them.
Rule #29: no rational discourse can happen in a thread cross-posted to more than two newsgroups.
rule #6 (Eddie Saxe): don't post to misc.test unless you understand the consequences.
Rule #547 (Arne Adolfsen): When people know they're wrong they resort to ad hominems.
Rule #37 (Faisal Nameer Jawdat): Read the thread from the beginning, or else.
Rule #5 (Reimer's Reason): Nobody ever ignores what they should ignore on Usenet.
Rule $19.99 (Brad `Squid' Shapcott): The Internet *isn't* *free*. It just has an economy that makes no sense to capitalism.
Rule #3 ("Why 3?" "Because we felt like it"): For every opinion there is at least one equally loud and opposing opinion; sometimes stated as:
Rule #27 (Gary Lewandowski): "In cyberspace, *everyone* can hear you scream."
And for completeness' sake:

Rule #4: (Godwin's Rule) Any off-topic mention of Hitler or Nazis will cause the thread it is mentioned in to an irrelevant and off-topic end very soon; every thread on UseNet has a constantly-increasing probability to contain such a mention.
Quirk's Exception: Intentional invocation of this so-called "Nazi Clause" is ineffectual.
Case's Corollary: If the subject is Heinlein or homosexuality, the probability of a Hitler/Nazi comparison being made becomes equal to one.
- net.legends FAQ (http://www.killfile.org/faqs/legends.html)

Appendix B: Addendums, Commentary, and Miscellaneous

1. Bentsen's Defense

For some, there is another way around Godwin's Law:

"Not this time. I know Mike Godwin. Mike Godwin is a friend of mine. Senator, you're no Mike Godwin."

This, of course, only applies to friends of Mike Godwin. The originator of this rule, Earl Cooley III (shiva@io.com), is one of those people. If you have to ask, you don't apply. I don't apply, so don't feel bad.

Note that this was named after Senator Lloyd Bentsen's "You're no Jack Kennedy" line from the 1988 vice-presidential debates. And the original usage can be found in <3b09d2e6.79411309@news.supernews.com>:

http://groups.google.com/groups?as_umsgid=3b09d2e6.79411309@news.supernews.com

2. Godwin's Commentary

Godwin actually wrote a short article for Wired Magazine on the

Law back in 1994:

http://www.wired.com/wired/archive/2.10/godwin.if_pr.html

The article is actually more about the power and danger of memes (thought-viruses) than about Godwin's Law itself, but it's worthwhile reading for anybody who actually got this far into the FAQ.

3. Author's Note on the Holocaust

Over the years, I have received several emails regarding this FAQ regarding the Holocaust itself, either disputing the holocaust or the numbers listed in this FAQ. I'd just like to make it clear that I don't have any particular desire to debate these points; this FAQ is meant to point out and explain a quirk of human nature, not to codify the history of World War II.

4. Additional Corollaries

There have been many additional corollaries and otherwise related rules created since the net.legends FAQ codified them, and/or missed in that FAQ. Those that have been brought to the author's attention:

Stead's Law (named for Lew Stead of alt.pagan fame):
Any discussion between more than 2 Pagans will eventually come around to Christianity.
- Reported by Donal Brewich <donal@brewich.com>
- More information regarding its history would be appreciated

"I remember my days at RETS electronics schools we had a instructor his
name was Armstrong the cousin of the inventor of FM. In his class you
got to build a 100Mhz tube only scope, you bought all the parts from
him, nice scam, including the CRT, he made the CRT's himself from
scratch."

Doesn't sound like a scam at all unless he was seriously inflating the prices of the parts compared to what you'd normally get them for. Indeed, assuming the prices were in-line, it sounds like a great dead, since especailly for something like the CRT, he's the one warrantying it and you know exactly where the guy works. :-)

To me, the fact that His Law (in one form or another) is true proves
that He exists.

In the UK, in uk.radio.amateur, after about three 'overs', all threads
get hijacked and turn into a slanging match which is invariably about
the UK amateur 'Foundation Licence' (effectively a low-grade novice
licence). This is much more important than Nazis and the like.

```

(Followups directed to poster by default. If followup to newsgroups is desired, edit your headers on followup to drop rec.radio.amateur.moderated from the Newsgroups line, else your article will be rejected.)

The rec.radio.amateur.moderated newsgroup enters its 3rd year of operation this month. Since its creation in February of 2007, we have approved nearly 3,000 articles about amateur radio and closely related subjects. We would like to thank our readers and posters for their quality contributions to our newsgroup.

When we first started out, consistent with our newsgroup's Charter and Posting Guidelines:

http://www.panix.com/~rram/usenet/rram/

we allowed discussion threads to be posted to our newsgroup only. Our moderation software is programmed to automatically reject any crossposts. The one exception has been periodic information postings that are crossposted to rec.radio.info, rec.answers, and/or news.answers.

Some moderated newsgroups, such as those in the comp.lang.perl.* and misc.kids.* hierarchies, started accepting crosspostings to appropriate unmoderated newsgroups after a suitable waiting period from their initial creation. Now that our newsgroup is well-established and carried at most major sites, we would like to implement this customary followup and allow some crossposting. We would propose to allow simultaneous crossposting (i.e., one article, with all newsgroups specified at once on the Newsgroups line in the headers) to rec.radio.amateur.moderated and one other unmoderated newsgroup in the rec.radio.amateur.*, alt.radio.amateur.*, and alt.ham-radio.* hierarchies only.

Pros:

- Allows the moderated and unmoderated newsgroups to share discussion threads of common interest, without propagating more than one set of articles to news, or showing them more than once in a newsreader. Presently, threads of common interest have to run in parallel, with different sets of followups, and requiring readers to have to follow two threads, possibly with duplicate articles, in different newsgroups. We have seen multiple examples of this happening in the amateur-radio-related newsgroups over the past 2 years.

- Provides the default action of submitting articles and followups to moderator review, as news servers will forward to us for approval any article that contains rec.radio.amateur.moderated on the Newsgroups line. This allows the moderated newsgroup crossposting to serve as a "guardian" or "sentinel" to discourage threads from getting hijacked into running off-topic or into personal abuse. This may also encourage posters to use the underutilized rec.radio.amateur.misc or .policy newsgroups as crossposting targets for articles that might otherwise be posted only to .moderated.

- Readers of the unmoderated newsgroups will enjoy high-quality, on-topic, discussion threads that would otherwise require subscribing to and reading a moderated newsgroup. Readers of the moderated newsgroup will enjoy high-quality, on-topic, discussion threads that would otherwise require subscribing to and reading other unmoderated newsgroups. Those unmoderated newsgroups may contain articles of widely varying degrees of quality and topic relevance.

- Participation in this crossposting scheme is completely voluntary. Posters of initial articles in threads will make the voluntary choice to add rec.radio.amateur.moderated and one other unmoderated newsgroup to the Newsgroups line when posting. Those following up to these crossposted threads will make a voluntary choice whether to keep rec.radio.amateur.moderated or any other newsgroup on the Newsgroups line, or remove them. Followups may be directed by default to any subset of the newsgroups on the Newsgroups line (or via E-mail to "poster") by specifying them on an appropriate Followup-To line. In short, you control what you post, where you post it, and what default destinations you want for any followups. This proposed crossposting scheme does not change any of these long-standing features of Usenet and newsreader software.

Cons:

- This will subject all such simultaneously crossposted articles to moderator review by us. If they do not meet the Charter and Posting Guidelines of rec.radio.amateur.moderated, they will be rejected. We will attempt to work with submitters to let them know what is happening, and how their articles can be fixed for eventual approval. However, rejected articles that were submitted anonymously without a traceable/derivable E-mail address or identity will have to be dropped silently without feedback to the unreachable submitter.

- Moderator review will introduce some posting delay. However, it has been our experience over the last 2 years that with our large moderation team distributed across many time zones, and the automation provided by our moderation software, we can turn submissions around relatively quickly, often within an hour.

- Many newsreaders do not give clear feedback to the user what newsgroups in which a given article appears, nor to what newsgroups a followup to that article will be sent by default. We expect to initially have to handle a few confused, possibly angry, submitters who will insist that they did not intend to post to a moderated newsgroup. We are willing to provide the necessary polite feedback and user education to them to allow this crossposting scheme to work effectively. This will help ensure that the scheme is only used by those who are reasonably aware of the various pros and cons. We hope that this problem will diminish with time and greater user awareness.

- Not all newsgroups, especially those in the alt.* hierarchy, are carried at all sites. Users may find themselves following up by default to newsgroups that do not exist on their local news server, possibly resulting in article rejection from their server. Those users would have to edit their Newsgroups line for successful resubmission. We will work with users to get appropriate newsgroups added to their local servers, as well as with Panix to get those newsgroups added to Panix's server. However, as with default followups described in the previous paragraph, we expect to have to go through an initial period of user and news service provider education and polite feedback. We hope that this problem also will diminish with time and greater user awareness.

We propose to enforce this scheme in our moderation software as follows:

- Submissions simultaneously crossposted to more than 2 newsgroups will be automatically rejected with a rejection form letter (same as what happens now to submissions that are posted to more than 1 newsgroup).

- Submissions that contain newsgroups on the Newsgroups line other than approved newsgroups in the rec.radio.amateur.*, alt.radio.amateur.*, or alt.ham-radio.* hierarchies will be automatically rejected with a rejection form letter.

  Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

  Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

  We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

To help publicize this new editorial policy, we will update our Posting Guidelines, which are posted to the moderated newsgroup on the 15th of each month. Changes to our Posting Guidelines are indicated by an updated date in the Revision: auxiliary header at the top of the body, as well as "change bars" ('|') after each modified line of text. We will also add a short announcement, posted on the 1st of each month and cross-posted to the unmoderated newsgroups, restating this new editorial policy, and encouraging crossposted submissions.

Since this is a change to our newsgroup's editorial policies, and with some impact to the readers and posters of the unmoderated newsgroups, we would like to solicit 30 days of direct feedback and/or public discussion regarding this proposed change. For example, we would be interested to know if allowing crossposting to one other unmoderated newsgroup is enough, or if two would be preferable. We feel that more than two additional crossposted newsgroups greatly increases the probability of misconduct or accidental misposting that may result in article rejection by us. Also, should this scheme be opened up to uk.radio.amateur and aus.radio.amateur.* as well? You may send us E-mail directly to our administrative contact address below, which is the default Followup-To/Reply-To for this article. You may also discuss this publicly on the unmoderated newsgroups. In fact, we cannot stop you from doing so. We will make every reasonable effort to incorporate any feedback and suggestions. If we decide to implement this proposal, we will make a public announcement shortly after the end of the 30-day discussion period.

(Followups directed to poster by default. If followup to newsgroups is desired, edit your headers on followup to drop rec.radio.amateur.moderated from the Newsgroups line, else your article will be rejected.)

I am not aware of this, but the chances are surely infinitesimal.

A related (psychological) phenomenon is: "the elephant in the livingroom" which is a tag label for people who are unaware of their own problems even though everyone around them can see it.

My own pet notions about newsgroup threads are as follows:

1. It is a fact that dogs, when out being walked by their owners (or dogs wandering on their own), go around and sniff fire hydrants and tree trunks for dog piss residue. Because of their olfactory sensitivity, dogs can identify other dogs on piss smell alone. So, its a form of communication. After the sniff, the dog pisses on top of the prior layer of piss to tell the next dog (maybe the same one as before) something like "Hi Joe, this is Pete", etc., and thus makes dog socializing possible (as for millions of years), and now, humans can do the same on newsgroup threads (read the post, reply to the post, etc., thus giving rize to terms like "pissing contest" etc).

2. There is a certain resemblance, to a certain degree, to the bar scene

in the movie "Star Wars"

3. I've also had the observations that: i) no matter what you say, and no matter what your intentions, there will always be at least one person out there who will be unhappy with what you say, ii) they will also completely misunderstand what you say, and iii) no matter what you do to try to explain it, it will still be misunderstood. In my retirement years I've been reading a lot of history; kinda makes it obvious why we've had thousands of years of wars, destruction, death, pain. Hmmmmmm? Is there a lesson there? On newsgroups, thus, we get flamewars as a substitute.

Two friends both bought a $125 dual DTV RX box; its output is TCP/IP and the
control input a web browser.

One antenna goes each way....

I've made a digital modem and am trying to figure out how much I need to reduce the modem's audio output before piping the signal into an IC-V8. I want to make sure the voltage is high enough to RX well, but not so high that the signal is clipped of the IC-V8 is damaged. Anyone know what the typical peak-to-peak voltage is for a standard mic input?

Thanks in advance for any advice!
Dave

========================

Assuming that the modem has an adjustable output , I would suggest you
hook it up to the radio and ,starting at zero input ,see at what mike
input level you get an output by listening to a receiver.
If the radio has its own mike being an electret type (possibly with an
additional built-in pre-amplifier) the mike input signal will highly
likely be in the 50 - 300 mV range .

Frank   GM0CSZ / KN6WH

Hi  All,

 1) I  want to implement MODEM with 128Kbps at 100Khz  with high
doppler shift channel. Which modulation technique would be suitable .
Whether I can go with OFDM or SC-FDMA?    Any suggestions

 2) Is it possible to simulate  128Kbps with Matlab

Thanks & Regards,
Ammankumar.S

That looks like it but I'd have to ask to be sure...

Ive been playing around with some old UPSs that are the switch mode
type, the ones without the big iron transformers. I m not sure if I
have a handle on how they work or not but it seems very similar to a
Class D amplifier amplifiying a 60HZ input, well sort of. It seems
like they dont actually input a 60Hz signal rather they just go
directly from digital by generating the pulse width modulated
waveforms with a computer. I was thinking that a transformer might be
placed before the output low pass filter to step up the voltage for
tube circuits, maybe even a TX PA. No doubt for this to have any merit

the LPF would have to be redsigned.

Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

```
 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month
```

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

There are a number of different topologies. One is to convert the 120VAC to 167VDC and then chop it up, usually >20khz and feed that to transformers to convert to the desired voltages, and then rectify and filter it once again to get the DC outputs.

The utility of a SMPS is the efficiency, and the light wieght. Efficient because it operates class D and light because the magnetics at high frequencies are much lighter than 60hz.

The downside of SMPS is the electronics are rather complex, and the magnetics are hard to (for me) design.

I don't see any reason you could not modify a SMPS to get a couple KV for Tube operation. Seems I remember someone advertising a SMPS capabible of KV output, but I can't put my hands on it. Keep in mind that a SMPS will tear up you receiver all up and down the bands unless it is very well designed to eliminate noise.

I use a commercial 50VDC 22AMP SMPS to run my 600 watt solid state amp.

Gary I have likewise used a UPS for a DC power supply by taking the
voltage of from across the batteries. I briefly had a similar amp that
I was repairing for a friend and thats the way I powered it.

Hey OM

Sometimes you see 2 transformers in these SMPS and one is a magnetic amplifier. Just before transistors took hold they were using mag amps . The Germans were experts in mag amps and we got the tech from them after WWII. I think one could have a mag amp for each hf band. Who knows if it weren't for transistors we might be using mag amps all over the place. You can't get much simpler than a hunk of wire on a magnetic core, there's no money to be made there. And mag amps don't blow out like semiconductors. they aren't effected by huge EM pulses either.

Mag Amps were used quite a bit in battery chargers, AC motor controls, AC generator excitation systems, voltage regulators ect., they were as you say, simple and rugged. I think it was in the 80's when power semiconductors started getting bigger and better that they started to get phased out. There is a book about mag amps written in 1960 that you can download on the free tech books site. It talks about how amazed the British engineers were at the Germans use of mag amps in their rockets and fire control systems. Even though vacuum tubes had been around for several years, the Germans discovered that mag amps were superior in many applications.

I don't think they would make a very practical HF amplifier, because they operate with AC supply voltages. They will not effectively amplify an AC voltage whose frequency is any higher than its supply voltage frequency. That is why mag amps usually operate at 60HZ, there are plenty of 60HZ power supplies around.

Ive worked on equipment that used magnetic amplifiers for over 30
years but have never really gotten my head around how they worked. Ive
seen them used in welders,computers and radars,all now very obsolete.
From what I have read they sound a lot like a parametric amplifiier.

Jimmie

Class C operation seems very well suited to HF CW operation. At least if the resulting envelope looks "nice" by ARRL handbook definition of keyclick reduction, I guess.

But is it good enough for RTTY?

How about for PSK-31? Olivia?

What I've got is an old Eico 720 (Novice 75W-class transmitter biased for deep class C, for those too young to remember) that I currently use for CW, but would like to try out for RTTY or maybe PSK-31 by feeding appropriate waveforms into the "VFO in" jack. My gut feeling is that RTTY would be OK but don't really understand how class C will mess up the PSK-31 waveform or introduce intermod that will make the resulting spectrum broader than necessary.

The Class C stages will clearly fail the usual SSB two-tone testing but what is a more appropriate test to say that it's good enough - or not - for PSK-31?

Hoverman design for UHF TV:

<http://www.digitalhome.ca/ota/superantenna/design.htm>

More reflectors would make it easier to bond them together (ie, a screen with
only horizontal elements) for more physical strength.

Does adding more reflectors introduce any negative byproducts?

I see that in this design the reflectors are of particular lengths. Does this
imply that lengthening them is counterproductive?

Thanks.

From the discussion on that website, they make it sound like the
antenna is pretty insensitive to whether a reflector screen or
individual tuned reflectors are used.  But it's obvious that there've
been several folk involved with modelling and building these antennas
in that group.  Have you tried asking them?  Seems like they're the
ones with the experience.

It's nice to see a practical homebrew antenna design like that.
Thanks for posting the link.

Cheers,
Tom

PSK-31 is just slow phase-shift keying, no? If the 720 had very
narrow tuned circuits in it, it could be a problem preserving the
fidelity of really fast phase-shift keying, but for the speeds
involved, a very tiny percentage of the bandwidth of the transmitter,
there simply shouldn't be any problem. I suppose there could be an
issue if the transmitter tries to self-oscillate, but if it does,
you've got bigger problems than PSK-31 transmission!

Cheers,
Tom

If the signal has a constant envelope then it'll be fine with class C.

RTTY should be fine, I don't know about PSK-31 or Olivia.

PSK31 uses a raised cosine amplitude weighted amplitude function in order to contain the occupied bandwidth. Use of a class C amplifier disrupts the weighting and causes the bandwidth to spread considerably. The demodulator will still work fairly well but the spectral spreading is considered un-neighborly!

So, PSK-31 is out.

(Unless you want to get fancy and amplitude modulate to preserve the envelope at the same time that you phase modulate the VFO input to preserve the phase. There's almost no sane reason to try this, but it'd be fun if it worked. Kind of a "Look how well my old iron works! (pay no attention to the DSP behind the curtain).")

A plate modulated AM transmitter is basically a class C amplifier with variable supply voltage, unfortunately it is hard to get 100 % modulation with such simple systems, i.e. it is hard to get the power down to 0. However, much of the PSK-31 envelope can still be simulated.

Plate modulated AM transmitters for voice communication might have a modulation transformer with a quite limited bandwidth, which might not work well the slow PSK31 envelope.

Its not just a matter of whether or not it will work but whether it
not it will work within the confinments of the allocatted bandwidth. I
think any mode normally used with a SSB transmition would probably
flunk this test.

Jimmie

I would like to experiment with some magnetic amplifier circuits but I havent been able to find any practical circuits I could build. I am interested in relalitively small signal amplification of AF and possibly ultrasonic frequencies purely for educational purpose. I have a couple of transformers and wan to see what I can do with them.

Jimmie

I've seen this discussed on sci.electronics.design, and there are
probably folk there who can help you.

Clifford Heath, VK3CLF.

Jimmie, download "Magnetic Amplifiers" by Paul Mali. Google and it is
free. I mentioned this in the HV SMPS thread. This is the only text
I have ever read on Mag. Amps, and it is good. Should give you ideas
for experimentation.

Gary N4AST

Hey OM:

I can see a great linear amp antenna output switch. I've been looking
for a cheap way to switch all that power and vacuum relays I don't
have in my junk box. I do have some T200's and FT240's. Using a small
DC voltage to saturate the core on and off, making the output coil
switch from a milli ohm resistance to thousands of ohms of impedance.
Sweet.
I know mag amps were used in audio applications, I can see a QRP rig
with no transistors or tubes. Using just toroids.

My experience with them has been limited to pulse amplifiers but I was
under the impression that they could also be used in a linear mode, at
least it seems I heard that some where. It would be neat to have a
stereo amp with no tubes or transistors. As far as QRP goes I dont
think they work well above 1 Mhz but that was best info I had 40 years
ago. With new core mixes it may be possible.

I was misled by a local tv broadcast stating a survey was done on grovernment grant assitance programs!!
 Well it must have been a bought advertisement instead of a survey,it pointed out certain sies to steer away from but also recommened this one highly.

grantfundingsearch.com

The informercial said these people only charged a shipping fee! So I jumped on the band wagon a free government grant to never have to repay and all you had do was order the cd explaing the how to !!

I gave them my credit card information to charge my account $1.98 shipping. After recieving the CD it was a disappointment it only told you to be proper and ernest and use request letter that would not be shit canned!!

Not what I was looking for at all,I wanted specifics maybe something I could simply sign and be considered since soo much research had gone into the program being offered!!

$1.98 well I felt decieved yet it was a cheap lesson and I forgot

about it!! Three months later I recieve a statement from
grantfundingsearch that my account was charged this time for $69.95
which after a call was told that I was put on a 7 day trail if I was
unsatisisfied I was to cancle my subscription!

I had to give the phone to my wife as I was not easily adjusting to
the DOT HEAD on the other end!! When I returned from a cooldown walk

>> The wife told me That Not only did I get scamed for the CD$1.98

yet I was charged for a membership fee of $69.95! The fine print gave
me a time limit to deny the charges or else they assumed I was
wanting
to become a member of this Scam Organization!

How low will they go well not only had I not advised them via email
or
a written statement, that I would be charged on a regular basis..Who
knows how much or for how long!! I hope the FEDS does there job here
and bust the chops of this scam, However I'm afraid to think it is
most likely a FERDERALLY backed SCam opperation >>ORGANIZED CRIME
rides again

I recently acquired a HOME BREW double conversion 23 channel CB receiver, yes I now it's not a real boat anchor but given that it has 11 tubes plus several diodes , I thought I'd ask about it here. It looks very well made. I was hoping that some one would recognize it by tube line up. I have started drawing the schematic . It has the following tubes, 6EH7 (the RF amp) , 12AT7, 12AU7, 6BN8, 6HR6, 6BA6, 6BE6, 6GX6, 12AX7, 6AQ5, and an OA2. It has 6 RF and IF transformers.

The antenna is connected directly to an untuned transformer with the RF amp feed by a cap off the secondary. The first oscillator uses a 29305 Kc crystal for the first oscillator stage. So a simple change of crystal will put it on 10 meters AM. It has a =93S meter=94 and what I suspect is a meter adj. pot on the back. There is a octal socket on the back labeled transmitter that has two lines jumped as well as a voltage divider with a large electrolytic to ground in the middle of the divider.

The tuning cap is three section with one section switched by a control on the front panel. The tuning cap is driven by a very nicely home made dial cord mechanism with a heavy flywheel. So far I have figured out the RF and audio gain controls. The other two front panels pots function are a question as well as the functions of four multi section toggle switches. With the filter caps being bad. I have not powered it up for more than two minutes.

Does anyone remember a home brew rig with these features HAM or CB? I would like to find a schematic if possible. As I am only about half way through drawing up one. I looked at the HBR site and it doesn't seem to match anything there. But given the limited 23 channel coverage (plus channels A-D) it looks like it's from the late 1960's or real early 1970's .

Thanks For any Info.

Jim

Maybe its a copy of a Browning Eagle CB. These were popular back then, . I remember there were some people making a Super Eagle transmitter back then. It had a 6146 final. I think the guy making them was from Baxley Ga.

I worked on gear that used them when I was in the USAF. Pretty neat way
to regulate a DC PS.

Hey OM:

Multi Elmac used to be just down the street from where I worked and they made a double conversion 9 tube receiver a model PMR-8. They sold the S meter as an accessory.
Looks like 3 stages of IF. So 1 RF, 2 mixer, and 3 IF transformers.

I have 3 mast mounted nuvistor pre amps less power supplies. I was looking for information on these to convert them to use on the 6 and 2 meter and 70cm ham bands. I may still have a power supply around but as of yet I havent been able to find it. The pre amps are mount in a somewhat egg shaped plastic container with twin lead connections on them. Im not sure of the manufacturer. Schematics on the amplifiers and power supplies would be nice. Directions on doing the mod would be great. There are plans for ham band nuvistor preamps around so if I could figure out what I have it shouldnt be that difficult to conver it to what I want. Besides that it will give me something to do with these old 6cw4s.

Looking thru a friend's Feb 2009 QST, saw an article on the W6TC "HBR" double conversion homebrew radio. Which my father may have built a copy of. I no longer have that radio, but looking at the pictures of teh sets in the QST article, it looks very similar to what my father built. I do remember that he used a 1.8MHz crystal for what might have been the 1st IF to 2nd IF conversion mixer. I also remember, in the mid 60's (I was in grammar school) getting this crystal for my father as an Xmas gift (well, I gave him money that he used to order the crystal, I would not have been old enough to know how to mail order stuff myself yet).

Anyway, did the HBR use a crystal of a frequency like this as a conversion local osc mixer? Or maybe the crystal wasn't in an oscillator circuit, but maybe as a bandpass filter?

I dont know about HBR but Bill Orr published plans for a radio like
that.
The radio was intended to be use with external down converter to cover
all
the ham bands.I think it was a pretty popular construction project for
a lot
of hams.

pmillet has copies of old copyright expired books and I think they
have a copy of Bill Orr"s
handbook that will have the plans I am talking about. You can download
the books for free.

The HBRs were a series of receivers designed by the late Ted Crosby, W6TC and published in QST during the late 50s and early 60s.

The design used plug-in coils for the osc and rf stages, and they were double conversion designs, with a first IF of 1600 kc and a second IF of either 100 kc or 85 kc (when using surplus ARC-5 IFTs.) The 1800 mc xtal you bought your dad was used for the second coversion osc. to convert the 1600 kc IF down to 100 kc. Many hams deviated from the exact original IF frequencies (i.e. strong local BC station on 1600 kc) which might explain why the xtal was chosen for 1800 kc instead of 1500 or 1700.

I'm gathering parts to build a more updated version, using half-lattice filters salvaged from Heath HR-10 receivers for a first IF at 1682 kc.

Pete

We have a local mid power station at 1600KHz, WWRL, at my parents' house,
so my father might have wanted to avoid problems with it.

His radio had a bandswitch instead of plug in coils, and he'd receive
various broadcast SW stations.  He wasn't a ham at the time just yet.

=A0

I had a friend who was a retired engineer with GE turned TV tech who
built
one with a band switch and he later modified it to
be more of a general purpose SW receiver. His name was Olin Griggs.

Jimmie.

You would do good to find a 70's or earlier ARRL handbook. There were
many articles about Nuvistors.

I used to have access to the handbooks of the 60s and early 70s. I
thought those were some of the best years. Im always on the lookout
for some but it seems a lot of other people share my opinion and dont
want to part with them.

Jimmie

>like 6 inches instead of the less than 2 inches shown)

I don't think that this is necessarily true. There are many valid antenna designs in which the reflector spacing varies quite a lot from 1/4 wavelength.

In Yagi designs, for instance, the spacing between driven element and reflector has a big effect on the antenna's feedpoint impedance, and is sometimes set to yield a convenient feedpoint impedance match with the cable. It doesn't have all that much effect on forward gain.

With a "sheet reflector" antenna design, I suspect that the reflector spacing won't have much effect on either forward gain or on front-to-back ratio. It's entirely possible that (in this design) it was set as it was in order to result in a not-intolerable impedance match over the relatively broad range of frequencies that this antenna needs to be able to cover.

>   and you need to
>mount the antenna 'in the clear', and point it towards the transmitter.

Yup, that's best.

No doubt, so I don't think a wooden antenna is the final solution. Best

check out how the scheme might work with scrap wood and coathangers and if that works then you could upgrade to finer materials for a more permanent solution that works in the rain.

On the other hand it may work well for you in spite of the loss in gain.

-Bill

Nice idea in theory, bad idea in practice, since you can't monitor his PC.
If something illegal goes on from his computer, your IP address will be
logged as the source.

I note a valid objection to this thread going OT and will not post on it
again.

That's what spar varnish is for. Metal booms with the uninsulated
elements going through are probably more "shorted" than from wet wood!
When aluminum is out in the rain, it's just as wet as wood would be.
The water may detune it slightly. Wood can be a great choice for boom
material (with proper varnishing)...it would probably outlast an
aluminum one in a salt air environment....

In this case the wood is being used as the feedpoint insulator.

Hi Brent,

This is actually very good, well done.

If it could be made available as a stand alone application you are
heading towards a very useful educational tool.

I would prefer not to have the animated aircraft, but otherwise
excellent.

-Mark

Wood is fine, it has been used for UHF colinears for decades....
The trick is to have the elements supported (in contact with
wood) at the low voltage,
high current points. CC made a colinear back in the 60s
that used good insulators, but had them on the high voltage
points, which affected the antenna's performance.

Pete

Criminal penalties apply to computer crimes that could be committed via such a shared connection. Notable are the downloading of child pornography (a five-year federal felony in the US) and the misuse of a "zombie" computer for conducting a distributed denial-of-service attack or for sending spam.

In these and other computer crimes, the shared connection is via the subscriber's IP, no matter where the misused computer is located -- in the house, in the barn, in the street, next door, etc. The authorities want to talk to YOU!

Even if the person with whom you share your connection is a model citizen, you still face a risk of misuse out of his sight.

I hope I've made my viewpoint clear.

No it hasn't. The original thread, 'Hack a DTV antenna for dual
directions?' has been hijacked, and changed to 'Sharing Internet
Connection'.

So now it is a new thread "Sharing Internet Connection". That is
what was requested. No need to put more comments about changing thread
into there.

I thought that mine did!

When the tree is collapsed, the subject is 'Hack a DTV antenna for dual
directions?' It's only when you expand it, and look 66 postings down the
tree, that you find that some idiot has changed the subject to
'Newsreaders that thread by subject'

Are there any news readers which allow you to rearrange news posts,
which have already been received, into a separate, new thread, and then
have further incoming posts automatically routed there?

My newsreader, slrn, does just that.  It is starting a new thread at
toplevel everytime you change the subject.

Your newsreader is broken -- it doesn't understand threads. Here are all
the contributors to the "Hack a DTV antenna for dual directions?"
thread:

```
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
References: <0001HW.C5C7191C011A1E44B01AD9AF@news.sf.sbcglobal.net>

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

They are all in the *same* thread, even though a couple people changed
the Subject on the way.

In the world of Usenet groups, changing the Subject line does *not*
start a new thread.

But maybe it depends on the news reader? I suppose it would indeed be a
neat feature if it did this!

True enough if the design work has been do to ensure that the high impedance points arent in contact with the wood.
In the concerned case this may not be and probably isnt true for all frequencies concerned..

Jimmie

Then stop the discussion about starting a new thread, as that just isn't
going to happen.

Glory be to God! I failed absolutely!

No, no NO! What I said was: Do NOT trust your neighbor with your Internet connection. He is not as concerned with keeping you out of prison as you would want him to be if you are a freedom-loving soul. His misdeeds (or the misdeeds of people who have access to his computer, connected wirelessly to your 802.11 Internet connection) will be blamed on you. He does the deed -- you get the beating.

If there is no life without risk, go down to the packing plant and stick your dick in the pickle slicer. Maybe nothing will happen.

Seriously, do the headers retain a record of a past thread when the subject
line is changed? I ask because I do not recall whether I did that or
whether I went to the <File> menu and initiated a <New News Message>.

When I saw the complaint about being off-topic, I really, truly, sincerely
wanted to comply with general NG etiquette (and I thought I was doing so).

I already Googled for NG etiquette and got a lot of stuff, nothing conclusive on this subject. URLs, please. If I do wrong, I need to undo it.

Answering my own question, for some newsreaders, a change of the subject
line DOES NOT create a new thread.

Therefore, to avoid taking the "Hacking a DTV Antenna ..." thread off-topic,
I should have posted a new message.   We're all still learning.

OK, throw on another coat of varnish if it makes you feel better...I
usually use 3 heavy, slopped on coats...I don't care about runs or beauty ;)

Scott

The hardest part to build on an oscilloscope (while still maintaining bandwidth) is the final deflection amplifiers.
Something had occurred to me a little while ago. There is a readily available supply of chips that will do the job in a specific product. That product is CRT SVGA monitors.

The video amplifiers that drive the grids of the electron guns.

Normal supply voltage is 80 to 100V.
Normal output swing is 10 to 75V or 10 to 95V
Normal signal input voltage 0 to 5V
They are capable of driving 8pf loads which is close to the value of a deflection plate.
Output response times are 10us or faster. Some of the newest are down to 2.5us.
Corresponding bandwidth is DC to 50 or 200MHZ
They normally come in a self contained package that contains three amplifiers.

Since most scope most scope tubes take less than 80 volts per plate for full deflection (all the ones i have seen), then they make a great deflection amplifier.

They would be great for upgrading an old tube type scope up to a solid state 100Mhz unit. The rest of the amplifier chain would be easy to built. They would also be great for building a scope from scratch. Remember to keep lead lengths short, and use shielded interconnect cables, because at 100Mhz it will oscillate if it can hear it's self.

That is what I am currently doing to an old EICO scope. I already have the vertical amplifier in place. It uses two sections of a VPS10S. For The horizontal amplifier I am going with discrete components, because it doesn't need to be as high of bandwidth. I have got the horizontal amplifier built, and I just need to get it mounted.

The next stage is the amplifier stages between the input, and deflection circuits. They are all going to be 5V rail to ground. There will be a couple +10 and -5V point in the circuit for level transition, and signal inversions. And I have to build the horizontal oscillator and triggering circuits.

The only thing that has been bugging me is, what can I do with the old tube sockets. I have been trying to think of some tube circuits I could use. The only things I could think of is a high impedance input buffer. Or use a 6AL5 as a wide band RF rectifier. Or I could put in a sweep oscillator and a IF amplifier and make a rudimentary spectrum analyzer.

Wow, I admire you for even thinking of tackling something like this!
You're right that the video drivers from modern fast monitors should
work fine for deflection amplifiers, perhaps with a bit of care about
frequency compensation, and so long as they have enough output to
drive your particular CRT.

On the other hand, it does seem like a LOT of work to go to
considering that you can get a really nice used analog scope for under
$100.  I have an HP1715A 200MHz 2-channel scope with nice main+delayed
sweep that I need to put on ebay (or equivalent), and I seriously
```

doubt I'll get $100 for it.

If you do go to all the trouble to revamp your Eico (maybe the same scope model I started with almost 50 years ago??!!), I do hope you'll put a good triggered sweep in it, and not just a "horizontal oscillator." It's not too difficult to make a very respectable linear sweep with op amps and fast comparators these days. For triggering, for example, have a look at the Analog Devices ADCMP02 and its siblings: fast, built-in hysteresis... I'm using one in the input of a counter, and it goes to 100MHz easily for low level inputs, and to well over 200MHz if I jack up the input a bit.

Cheers,
Tom

I have the old scope laying around so why not? And almost everything I am using in it is salvaged parts. Including capacitors, transistors, transformers, and the video chips in question. I will probably have under 10 dollars in it after I am done. (That includes the $5 I paid for the scope a few years ago.)

For the sweep, I was planning on using a transistor as a constant current source to charge the capacitor for a nice linear sweep. And use JK or D flip flops for trigger and state control. The flip flops would be triggered and reset by comparators.

The clock input to the flip flop will be feed from a comparator and used as the trigger input. When the capacitor reaches a certain value (end of sweep) a comparator would reset the flip flop. When the flip flop rests, it will discharge the cap. After a dwell time (cap discharge period), the data input to the flip flop will be brought high. The next clock input (trigger) will set the flip flop and the cap will start charging which commences the sweep.

I should be able to do the sweep and triggering circuit with a dual D flip flop, a quad comparator, and a transistor with some other components. with a comparator and D flip flop to spare.

Yes, and I screwed it up by changing the <Subject>, thinking I was creating a new thread. However it doesn't always happen that way.

It went off topic, I followed and was called on it. The attempted "fix" turned out to be my screw-up.

Hi,
```

Early TV's used them in their power supplies. Some used a SCR, others used fancier devices.

MOSFET's give a higher efficiency and are a lot easier to drive, so they were pretty much abandoned.

Cheers!

I've done it in the past, but they're not really capable of high frequencies (mine was at 173 kHz).

> Because a power mosfet is far too expensive to hobby around with.

What? The IRF730 (for example) is capable of 50 Watts at up to 25 MHz for very little drive, and costs under $1!

Bob

The main problem I see is the fact that they are generally designed to lock into the on state, until the load current drops to zero. For a switch mode power supply, the switching device has to be able to break full current. If you used an SCR it would lock on, and things would melt under most conditions.

The only switching circuits they can be used in is circuits that are designed to drop to zero on it's own for the SCR to unlatch. Like AC load control, where the sine wave drops to zero at a 120 times a second.

Like the old computer line printers. They had a bank of SCRs driving the printing heads. The inductive rebound would bring the current to zero and allow the SCR to unlatch after triggering. But If one stuck on, you better shut the system down quick, or the thing was going to burst into flame.

They are relaatively slow, You might could build a VLF transmitter
using them.

Jimmie

>

Thanks for posting this interesting topic! I thought no one else cared about CRTs. I've been messing with scopes and CRTs a long time. It's always fun. I always see the 3" tubes built into people's projects, running on 1-3KV. They are never very bright. I like the larger 5" ones of recent manufacture (recent being a relative term). Half the fun is doing it yourself. Even the HV supply is a fun project when you get into serious scope tubes. In general, it will take at least 6KV to get a real bright one going. - but the tube has to be able to take it! In case anyone needs a good CRT, there are many here, for cheap, and quite a few HP or TEK types:

Yes they would however the circuit complexity is higher. Other than the frequency issue the problem is turning off the SCR. This requires some careful design techniques to commutate the SCR off once it is turned on. That's where the complexity comes in to play. Various methods are used to accomplish this. Also SCR's have other problems too such as turn-on di/dt limits, dv/dt limits at turn off (which can cause retriggering), recovery time requirements, high recovered charge etc making snubber circuit design a challenge.

Hey OM:

I remember my days at RETS electronics schools we had a instructor his
name was Armstrong the cousin of the inventor of FM. In his class you
got to build a 100Mhz tube only scope, you bought all the parts from
him, nice scam, including the CRT, he made the CRT's himself from
scratch. I didn't get him as an instructor so I missed out on a great
deal. We got to play with computers the relay tube type. When I
graduated, Armstrong finally broke down and put an FET into his scope.
I have to add that his scope was flat + - 3db all the way out to
100MHZ. dual trace with a triggered sweep.
Don't forget your astigmatism

Hey OM:

Really though sounds like you have low and high band VHF wideband
preamps for maybe TV use. The low band being 54 to 88 MHz and the
high band is 174 MHz to 230 MHz. So 6 and 2 meters is doable.

I don't know if you could squeeze UHF out of them, 6cw4s' input C is
way to high.
In tube TV's they used 6af4's for the UHF band half the input C of a
6cw4. And even that was a oscillator not a preamp.

They aren't that hard to find :-). The early-mid-60's handbooks would
be your best bet for finding Nuvistor construction articles.

But what you really want is to look up the 60's QST articles on
Nuvistor based preamps:

Sep 1960: Nuvistor as an RF Amplifier at 144 Mc
Jan 1961: K1IJB Nuvistor Preamplifier
Aug 1961: Nuvistor Preamplifiers for 50 and 144 Mc
Jul 1962: Nuvistor Converter for 220 Mc
Jul 1962: Improving Performance of Nuvistor 144 Mc converters
Aug 1962: Using the QST Nuvistor Converters with Amateur-Bands only
receivers
Jan 1963: An All-Nuvistor Convertor for 420 Mc

Apr 1963: Two Nuvistor Converters for 220 Mc
May 1963: Nuvistor Goes Mobile on 50 Mc

If you get the impression that early 60's was the peak for Nuvistor usage, you'd be about right. The August 61 article is IMHO the definitive one on preamp usage.

For using a TV preamp, all you'd want to do is remove any traps that get rid of the ham bands. But you'd do much better with tuned input circuit for only the ham band of interest.

You can download all the above for free from the ARRL if you log in with your member ID. With all the old QST's available on the web, everyone ought to be a member!

6cw4s may not be what is in the amps but I do have a few and a few
others. I thik the 6cw4s were something I bought for a project and the
others are left over from when I worked on TVs back in the early 70s.
They are probably the right kind. Im pretty sure I kept these preamps
because they worked because at one time I had a bushel of them most of
which had a fair amount of lightning damage.

I once saw an article in 73 magazine showing a HB receiver that used a
re-worked turret tv tuner as a band switch.  The coils were re-wound
onto the original forms, but some have just replaced the forms with some
of the smaller sized toroid cores.  I have a bunch of old tv tuners in
the junk box, but over the years the contacts have gone bad and now show
a high resistance.   Maybe they could be cleaned up, but it no longer
seems worth the effort.  My new idea is to use miniature relays to
switch the circuits.  I recently found nearly a gross of small relays
for free so why not?

Hello Folks,

Has anyone ever had this happen and maybe knows what could be wrong?

The Icom R1500 behaves like a PCR1500 when controlled via the PC. Or so says Icom. When I try to control it through the virtual COM3 port via USB it seems to have lots of data traffic jams. If I turn the "virtual" dial too fast the R1500 seems to lag. Sometimes it doesn't react at all and seconds later starts slowly tuning through all the frequencies I had chosen. This can go on for half a minute until it has trundled out.

Audio is supposed to go via the same USB cable but not as a serial COM port. Well, that part doesn't work at all, no audio.

Relays will most likely bring some grief over the years with contacts
not conducting 100% and such. Better use band switching diodes or PIN
diodes.

Have you ever thought of JOINING ARRL, and using your position as
a member to petition for this change?

Change is made by those who participate.

There is a trick with relays, they must conduct a minimum amount of current or the contacts won't self clean. Using relays to switch receiver input circuits that are only passing micro amps will eventually cause problems. But, if you bias the circuits with some resistors so the relay must switch at least a few milliamps they will last longer. Another idea if the relays are computer controlled would be to switch in a high current source (few hundred ma) before opening or closing the desired relays, then switch off the high current source. Relays should not be any worse than switches as far as contacts go, however rotary switches would tend to be self cleaning due to the wiping action. Relays are often used in switching low pass filers used after solid state finals. Here they ARE carrying high current (rf output) but not switching it.

=============================================
Had this relay switching problem with my (almost vintage) Ten Tec
Paragon trx (AD 1988) a few years ago and ordered a relay from TenTec ,
but never had to  change ,because the original relay cleared itself.
Would suggest to operate  an 'ailing' rx relay a number of times ,eg
10-20 times within a short period ; its contact(s) might then clear itself.

Have you ever thought of JOINING ARRL, and using your position as
a member to petition for this change?

Change is made by those who participate.

--N1GAK
===============================
Agree with that ,although ARRL members should have a choice.
If they prefer QEX over QST they should have that option.
ARRL news is sent weekly  by e-mail upon request .Moreover, members can
access QST articles via the ARRL web site, and also can access QEX articles.

Living in the UK I have opted for the annual CD-ROM ,which is published
in March ,including QST , QEX and the Contest Mag. covering the past
calendar year     ,which suits me fine.
However I believe this option is not available to US residents .
Perhaps something to go for.

The name of the game is $$$$$.

They'd lose advertising revenues if folks were given the
choice. I vote with my WALLET; and I let them know it.
QST has been dumbed down to meet the needs of the
new 2x1 callsign holders--the ones who can't figure the
out how make a dipole or solder a PL-259. And the
fact they destroyed the competition (Communications
Quarterly) doesn't sit well with many of us.

Erm ... while I dislike contradicting you directly, I just tried to download a
QEX article, afer logging in to my ARRL.net account, and got the following:

: The ARRL Periodicals Archive and Search is both an index of articles and an
archive of downloadable material. However, not everything in the index is
available for download.
:
: The item you requested is not in the archive of downloadable information. This
may be because:
:
:   * Most QST material newer than 2005 is not available for download
:   * QEX, NCJ and Ham Radio material is not available for download

I subscribe to QEX as well as QST, and really would like QEX to be downloadable.
I see in my future a letter to the Powers That Be.

Yeah, I wish the designers of the NRD-515 here had known that as well.
Every few months a relay will become "sticky". The S-meter drops to
zilch, rock the attenuator switch 5-10 times, and it's back :-(

Relays with some current are ok but I prefer the electronic method. PIN
diodes with lots of current and plenty of carrier lifetime usually work.
One just has to make sure there aren't any rectification effects that
can cause IM or harmonics in the presence of strong signals. FET
switches are sometimes a good deal as well but since the SD5000 and
SD5400 have gone towards high-priced boutique status not so much anymore.

I tried the TV tuner trick one time and it didnt work well at all.
Most tuners are tossed because the contacts fail. Various contact
cleaners will only help for a while because wor out is worn out and
there is not a long term fix you can do for them. The exception to
this was a very old one I found that was at least as big or bigger
than a shoe box. Shame on me but I used one like this to build my own
CB radio tx. I was using it to switch crystals and trimmer caps for
the osc.

Not really. Back then TVs were often tossed because the flyback xfmr had
blown and repair was deemed uneconomical. Or someone said that because
in reality they wanted that brand spanking new set that was one sale.

But this is so long ago that if there's any left the contacts will have
corrodes away.

I disagree based on some experience in environmentally testing relays ranging from high-power to low-power to 'choppers' in so-called stabilized
(DC) amplifiers for military avionics, then doing comparative testing against the cheaper commercial relay designs on the market over 50 years
ago.

About the only "grief" is one can get is failure to wire it correctly or
not understanding what relay contacts acually do or how to power their actuating coils.

Power relays CAN result in contact pitting and poor resistance as a result
of many multiple activations while carrying inductive loads of many Amperes of current with resulting very high voltage back-EMF ('flyback')
conditions on contact separation. That is NOT the case with receiver bandswitching applications. Not even close.

There are some unusual contact effects in so-called "dry" circuits carrying femtoAmpere currents or less but those won't affect high-impedance input and output circuits common to vacuum tubes. One of the
better choices for no-nonsense, easier to implement bandswitch conversions without much cost is to use modern, easy-to-get small relays
requiring only 100 to 150 mW coil powers, available in coil operating voltage increments of 6, 12, 18, 24 VDC...or, if salvaging older tube equipment, the "plate relays" of a half century ago designed for higher
12 to 30 VDC, comparable powers for a few mA of plate current in coils.
[much harder to get now given all electronics is firmly in the solid-state era starting over 40 years ago] Some relay makers, such as Omron, are widely used in electronics, especially for automotive applications and are found listed in all major distributor catalogs.

Relay contacts can easily withstand 200 to 400 VDC stock of now v. old (half-century ago). The make or break contacts do NOT involve any unusual RF impedance characteristics other than a few pFd of capacitance
equivalent to ordinary point-to-point wiring or the lead-length inductance of some short point-to-point wire inductance in the low nanoHy range. It has an excellent open or closed contact condition with excellent isolation between actuating coil and contact set.

By contrast, conventional rotary bandswitch structures designed around 60 to 70 years ago, are open to all sorts of contamination, including OXIDATION of contacts plus wear of typically cheap contact construction of a bygone era. Sealed or semi-sealed rotary switch wafers of the post-WWII era have much longer life than the old open-to-everything wafer designs that may look good in their first half decade, then degrade from oxidation after that, before normal wear effects show up.

Based on over a decade of using the TV channel "turret tuner" (such as the cheap products of Standard Coil tuners of long ago) types just for TV channel selection, I wouldn't try to convert those to anything else than scrap. I'm being kind on that evaluation. The MECHANICS of such turret tuners may look good, but VHF-UHF circuits don't work on either mechanics or appearance. HF circuits might squeak by, but the typical contact set of turret tuners was never optimized for either wear or contact resistance. It was 'optimized' entirely for maximum profit from lowest-possible cost of components in a highly-competitive TV market of long ago.

Today there are a number of inexpensive small relays used in HF radio equipment, especially in automatic antenna tuners (used for switching banks of binary-progression-values of inductors and capacitors) from direct microcontroller control of actuating coils. Those work very well and show no degredation running with 100 W of RF or more at 50 Ohm impedances. Millions of automobiles on the road today are tooling around with little packages of relays controlling everything from headlights to sensor selection in adverse temperature ranges and high vibration, no real problems from those relays.

In short, small semi-sealed low-power relays are FINE for vacuum tube circuit switching in homebrew electronics, properly applied. They can easily replace most rotary bandswitching applications in layout with less stray circuit series-inductance and parallel-to-ground capacitance than with point-to-point wiring.

This sounds like a problem I had when I wrote an ICOM radio control
program in Visual Basic.
What was happening to me was the computer was sending control data for
every click of the wheel. The radio had trouble responding to this
much data. I changed the way the radio was tuned by installing virtual
buttons over and under each digit of thee display. Clicking on one of
these buttons would increase/decrease the frequency by
10,100,1000.....Hz.

Something that may cause a similar problem might be if the baud rate
is not set high enough on the radio. I believe on mine you could
select 2400 or 9600 baud. My software worked much better at 9600 baud.
At a slower baud rate I could click a frequency increase buton 3 times
then look at my radio and see them change the radio there was so much
delay.

Jimmie

I think the default baud rate of the R1500 is 38400 baud. Should be
plenty. But you could be right, there may be a buffer overflow somewhere
and then it chokes. Sometimes when it has finally trundled out it sits
at the final frequency but the mode didn't switch.

All I really want to do is use the set as a spectrum analyzer, at least
most of the time. And I am really wondering why the USB packet data
doesn't work at all.

Bob, try www.qsl.net/k5bcq/HBR/hbr.html for a rather complete
collection of
Home Brew Receiver photos, schematics, details, hints&kinks, etc.,
which is Kees Talen's website.  It isn't as squashed together as QST
articles (which don't cover all the HBR versions) nor does it have the
extra 450 KB warning page present with QST article downloads.

Yes, Sorry I wasnt thinking about it being USB and it sounded so much
like the problem I had. I wrote the program before USB ports were
around.
Have you tried another computer, remember you are running Windoze.
 I was thinking of getting one of those radios as I listen a lot more
than Im on the air. The earilest radio I have is nearly 20 years old
huge and clunky. Besides the computer interface not working as
expected what do you thin of the radio?

Jimmie

Well, it is USB but inside is a bridge. One data stream is serial and
(via the driver) the PC sees that as a regular COM port. The other part
is a USB packet stream. Or, in my case, should have been. Both via the
same USB plug.

It's pretty good. Does have some issues with very strong signals, I have
some TV stations burst into non-TV VHF, for example. Sensitivity above a
GHz or so is pretty poor but there ain't much there anyhow. The hardware
seems ok but the software that Icom supplied is not, IMHO. Also, this
radio could be a really nice spectrum analyzer but Icom doesn't seem to
understand the market potential there. Thinking outside the box may not
be their strength. So WinRadio is going to eat their lunch in that domain.

I bought it at AES. I'd go for the best price, "bonus" software such as
Bonito is IMHO not worth it.

Relays are ok in those applications, where there are actual currents
flowing. What I meant was pure signal switching with no DC currents.
Sealed relays, Reeds, mercury-wetted and such work quite well there. But
non-sealed versions have issues and a snap-on plastic cap ain't a seal.
Those problems became really nasty after we moved across an ocean and
all this stuff was in a sea container for two months. After that almost
all the band switching relays had problems, had to clean all of them.
Now I am down to one sticky relay every couple month or so. Some I have
replaced with PIN diode circuits and that, of course, made the issues
completely go away. But it's always a hassle to do in an exisitng circuit.

Hello Joerg

Odd you're having that problem with the NRD-515. So far mine
has been rock solid, except for the rotting foam disease in the
mechanical filters... But... I do have constant problems with
the relay that selects the external VFO in the NSD-515
transmitter! It always needs attention and cleaning. Its the
odd-ball relay that was added on the bottom of the mother
board. I'm wondering if you have had the same problem
with the transmitter (assuming you own the pair) and what
you did to fix it.

The ARRL derrives a lot of income from the QST
advertisements. Decreased circulation numbers would cost
them revenue. I'm sure the answer would be increasing
the circulation figures for QEX, and making up the revenue
there, but the logistics might be too great. That's why the
QSTs are delivered on a timely basis stateside; stale 12
month old adds delivered by CD won't make the advertisers
happy. I've complained about this in the past (dumbing down
of QST) and was told that they are serving the majority
of the membership with the current content.

Anyway, I feel I might have hijacked Jimmies' thread, and
I'll stop posting with this last comment.

Pete

Actually I only have the receiver. Besides relays there is one other
serious problem: The bearings of the tune encoder are seriously worn,
the shaft sloshes around. I am not looking forward to the day when I
```

have to disect that thing.

Rotting foam in filters? Whoops, I've got to watch out for that. As for
relays, my problem really got worse after all this was in a sea
container for a while and crossed an ocean.

You must be younger than me, Ive replaced a lot of TV tuners and
flybacks. It was in the early 80s that i first noticed
TVs becoming diposable and quit working on them. Luckily for me there
was still a lot of other electtronic repair work needed to be done.
Most of the local industry was becoming more electronic oriented in
their equipment and needed someone to maintain their equipment but did
not want to hire a full time tech. The sawmills, textile plants, food
processing plants kept me pretty busy aand i enjoyed the work much
more not having to deal with the usual customers.

Jimme

```

Ive been building a 6M amp using a 4CX250B. I was looking through the schematic of other amps to get an idea of what is needed for a plate choke. In the Sep 1984 QST page 12 I found a plate choke described as 1-5/8 inches of # 22 enameled wire close wound on a 3/8 inch Teflon rod. COULD THIS BE CORRECT??. That sounds like about two turns of wire to me.

I believe what they meant to say was 'close wind the wire until the coil is 1-5/8 inches long'.

I also do not have the Teflon(tm) rod that was also part of the discription. Would ceramic work as well?

BTW I have no plans of building a cathode driven amp as dhown in the article. I was just stealing plans for the choke.

Jimmie

Same here, in the early 80's I began to refuse fixing TVs and stuff. But even before that, I remember the flyback transformers for some sets being so outrageously expensive that a repair plain didn't make sense. Especially if it had taken out the H-deflection tube and some other stuff with it or the set itself had already been quite tired at the time it hissed its good-bye. This was in Europe.

That's called "dry" switching in the electronics industry, has been called that for over a half century.

> Sealed relays, Reeds, mercury-wetted and such work quite well there. But
> non-sealed versions have issues and a snap-on plastic cap ain't a seal.

Didn't say that that it was a seal. But...there are many kinds of 'seals' and there are many kinds of contact alloys which few hobbyists investigate.

> Those problems became really nasty after we moved across an ocean and
> all this stuff was in a sea container for two months. After that almost

> Now I am down to one sticky relay every couple month or so.

My wife and I own a nice 2005 model Chevrolet Malibu MAXX that we've driven in both driving rain with some intermittent ice to Wisconsin from California and back, to Washington state from California and back. It has two little boxes of many small-signal relays, only a very few qualifying for large-signal types. Never a problem since we got it in late June of 2005. Those relay boxes all have lids and the small relays have little covers and that auto has definitely been exposed to the environment many times in the last 4 years.

I can sympathize with your bad sea container shipping experience but consumer-grade radios (such as for amateur radio) were never designed to be exposed to sea evnvironments. Ask yourself how all those off-shore made radios made it to the USA? Inside standardized container boxes.

I didn't make my comment lightly or pretend that I know everything there is to electronics. I do know, by a rather large set of experiences that 'dry' circuit relays (hermetically sealed OR by reasonably-good individual covers) will work without having to be 'operated many times' in order to 'clean their contacts.'

I'll cite one application that is military, the US AN/PRC-104 manpack HF transceiver. About one-third of that backpack radio is an automatic antenna tuner so that one whip length can be optimized for best electrical characteristics. It does that with a rather conventional microprocessor control driving two banks of binary-sequence inductance and capacitance values switched by relays. It has been in operational status with the US Army since around 1984 and is expected to be phased out soon in favor of more modern HF-to-UHF transceiver designs. It's been a while since I've seen the guts of it but I don't recall that it had any hermetically-sealed relays in it.

Right now I'm beginning to start cutting holes for a rebuild of an 'ancient' HF receiver once made for my late father wanting to tune to some SW BC stations, principally Radio Sweden back in 1964. I've been fortunate to get a large collection of North Electric small sealed relays dating back to about 1955 production which I've already breadboarded for bandswitching use. Very familiar with relay testing, I found NO problems from 'dry' contact switching. The low capacitance to ground and minimal series inductance from the contact set do NOT upset any of the L-C circuits being switched.

> replaced with PIN diode circuits and that, of course, made the issues
> completely go away. But it's always a hassle to do in an exisitng circuit=
.

Yes, I have that in the filter board of my two decade old Icom IC-R70, all switched with 'RF switch' diodes (no registry number). If needs be, that entire filter board could be enclosed to prevent any problems from the environment. Icom used that sort of semi-conductor switching for ease of overall parts cost along with reduced labor costs to Icom. Such work fine at the LOW impedances involved (50 to 75 Ohms) but I've tried to duplicate that at 10 KOhms on a breadboard and have run into problems with diodes' own impedances affecting circuit operation. Those could be solved, I'm sure, but I didn't care to spend weeks fiddling with them for my rebuild project. The relay contact set had only the shunt capacity and series inductance to contend with and those were very low values and easily compensated for alignment.

I thought about a Z-50. I have one I use on a 6 Meter amp using a pair
of 6146Bs. I didnt know if it would work with the 4cx250s or not.

6.8 uh rings a bell but Im not sure.

Id rather wind my own if it will keep me from having to pull out the
credit card and pay more shipping than what the thing cost.

CHANGE is made by those who cozy up to the Old Boys Network of the League. The arch-conservatives there want only ONE thing: Preservation of their rank/status/title and the ability to Rule. The rest is just PR BS to convince members that They are 'for' members. As a voting member of the ARRL (until end of March) for two years, I've gotten a chance to 'vote' just once and then only for lower positions; candidacy for Director was unopposed so the incumbent was 'automatically' elevated to another term. Some 'voting,' not.

As one who has been around the electronics industry for over a half century, I KNOW all the styles of writing that are acceptable in written correspondence. After three such carefully-structured correspondences FAILED to get an answer (one Form Letter reply is not counted as any sort of real reply), there wasn't any point of wasting my time with them.

The Editor of QST seems technically inept but appears to have the 'company man.' The Editor of QEX is technically better but could spend more time going over manuscripts to 'tighten up' some text and yield more technical explanations in the same amount of pages. QST's flavor of presentation is getting more and more like 'Ham Radio for Dummies.' Ohm's Law of Resistance is apparently 'rocket science' according to QST pages...if there is any in between the blitz of self-important PR BS there. Bear in mind I've been (first) a contributor to, then Associate Editor (for two years) at Ham Radio magazine back before 1990 and when I did not have any amateur radio license (just a First 'Phone granted in 1956).

Yes, if one wants (marginal quality) PDF downloads from QST since the year dot, membership might be worth something. Most of those PDFs come with an inserted first page of copyright warnings which is about 450 KB size all by itself, always the same page. Makes a lot of difference in downloading over a dial-up connection. It is better to just plain BUY a CD of selected years rather than download the same thing over and over again. That has the advantage of greater monetary revenue for the League...something They NEED to keep the paid high-level staff in 6-figure annual incomes.

With paid membership (and its 'voting rights') comes a 3:1 ratio of surface mail spam to BUY BUY BUY this and that as compared to actual worthwhile news/information. Good copy, cleverly misinforms the 'lowered cost of shipping' (on 'specials') as 'member money savings.' Never mind that I can go to HRO or AES outlets and get the SAME product over the couner at the SAME price with NO shipping charges. Shipping direct from Newington Hq means they are pocketing the difference local stores make as profit for reselling, another small revenue booster for the League. Not much, to be sure, but it denies any real savings to paid members.

The usual rejoinder from League sycophants is "members get QST free!" as if that were an excuse. Hello? The paid advertising space in ANY hobby magazine pays the staff and most overhead (except fulfillment services, aka mail subscription delivery) to keep everyone working. CQ works that way, 73 and Ham Radio magazines worked that way as Independent periodical publishers for years until the advertisers had to tighten their economic belts. By virtue of being a virtual monopoly on amateur radio publications, the ARRL can offer the widest exposure to advertisers so, when economic chips started to deplete beginning around 1990, advertisers gravitated to QST with its demographic guarantee of about 120K 'sales' per issue back then.

Just WHAT has the ARRL gotten for YOU in the past decades? Their influence with the FCC is dropping, witness all the Report and Orders footnotes and denials on dockets 98-143, 05-235, and at least three of the 18 Petitions for change in between those two landmark regulation changes. The ARRL hasn't achieved any new bands on HF except for 5 channels at '60m.' They never got a whole band to play hams-are-vital-and-important to the nation in times of crises. Five CHANNELS. As if the 'technical experts' there had never seen the giant frequency allocation chart in Part 2, Title 47 C.F.R. that shows where everyone is allowed from 9 KHz to 300 GHz...nor did they seem to have a handle on government radio use in HF. The 'WARC' bands came about in 1979 (at WARC-79) by the ITU, not the ARRL. ARRL has yet to join the rest of the IARU in going for any LF bands for amateurs as they do in Europe.

For an excellent peek into thinking of the higher-ups in the League, just read their Minutes of Regional meetings. Most of it is just self-congratulatory high-fives among the insiders praising each other. WE don't get to see any talks of 'change' (horrors!) in much of anything. You might say the Spirit of AIG had invaded the ARRL long ago. In between asking for More Money for the 'Spectrum Defense Fund' and the 'Foundation' and 'Buying a Brick for the Diamond Terrace,' Will the League soon be asking for 'bail-out money' from ongress? :-(

Jimme
&&&&&&&&&&&&&&&&&&&&&

One book calls for an 8.2 uH choke.
One design is for using # 28 wire spaced 1 wire diameter on a 1/2 inch form and 1 3/4 inches long.
Another calls for 30 turs of # 20 wire spaced 1 wire diameter on a 3/4 inch diameter form that is 3 3/4 inches long. I think the wire stops about 1/2 inch from each end on that form.
If the z50 would handle the current it should be ideal.

Thanks for the info 32 turns is what I calculated. I was guessing on
the wire size/ spacing.

I found a circuit that uses a 50 ohm % watt wirewound resistor for a
plate RFC on a 4cx250.
I may have to try that.

Jimmie

Sure, but in a car relays always switch something that draws a serious current, more than a few milliamps. That works for a long time. Well, until a "weld wart" shows up, like it did on a relay in out Genie garage door opener.

> I can sympathize with your bad sea container shipping experience but

Usually they are carefully packaged and silica gel is included. When you move that usually ain't the case. Plus the radio was quite old by that time.

Hmm, I've had that happen even in $xxxxx lab gear, not quite consumer-grade. Never really with mil gear though but those guys can often design to "the sky's the limit" cost goals.

Sealed relays are ok. I also have a few really old ones here and so far they have never let me down. But I don't have enough to equip a filter bank with 15-20 in- and outputs. For that I've got a stash of HSMP-3810 PIN diodes.

>> replaced with PIN diode circuits and that, of course, made the issues

>

Yeah, anything above 1K or so is less suitable for diodes. That's where JFETs come in which, in turn, are not so hot for anything low impedance. Unless you use the fat expensive kind and they've got too high capacitances. Many fine FETs like the P8000 have gone over the rainbow bridge by now. I guess they only found homes in ham gear and that wasn't a large enough market.

I disagree considering that Digikey is one of the largest
distributors
in the world of electronics and offers so many different models AND
price ranges.  Then there is Mouser, and Newark, and Allied, and
Jameco, and Ocean State, and Futurlec, and....a whole bunch of
them.  None of those are 'giving away' anything.

> Sure, but in a car relays always switch something that draws a serious

I will disagree again, but not on our particular Chevrolet...I only
got a
glance at the electronics wiring manual at a local dealership service
shop and NOT all the controlled circuits were "serious current" ones.
But, if you are convinced that they ALL are, I can't convince you...

> Hmm, I've had that happen even in $xxxxx lab gear, not quite
> consumer-grade. Never really with mil gear though but those guys can
> often design to "the sky's the limit" cost goals.

Sorry, but that is URBAN MYTH among amateurs.  What amateurs
don't realize is that components are elevated in cost by EXTREME
ENVIRONMENTS required.  Sure, everything at room temperature
works dandy and one can use any kind of schlock parts and get away
with it.  Freeze it below brass-monkey temps or heat it more than
boiling water, drop-kick it across the room, run it under extreme
vibration, it MUST WORK.  Put most ham gear through that and you
won't have enough left to sell anything but its manuals on e-bay.
Been
there, done that for years...its what I did for a living.

----------------<on the AN/PRC-104 HF transceiver>
> But I bet no expense was spared to pick the very best parts for that radi=
o.

I'll bet you've never seen the inside of it, let alone talk with any
of the
staff at Hughes Ground Systems that designed it.  If you want to
```

investigate it, the TMs (user to depot level) are available on the
'Web.
Hard to find and you may need special clearance to access some
military sites nowadays, but it is available for nothing. If you want
to
pay money for such a manual, fine, those are easier to get.

> Sealed relays are ok.

Thank you for such permission. I was using salvaged components
from junkyard electronics a half-century old and know how to test
things that are salvaged. Note: I'm not just making conversation
here,
I'm trying to point out a few things which defy Urban Myth and what
the ARRL deems 'useful' for amateurs.

> I also have a few really old ones here and so far
> they have never let me down. But I don't have enough to equip a filter
> bank with 15-20 in- and outputs. For that I've got a stash of HSMP-3810
> PIN diodes.

I'm not swayed or impressed by a bunch of house numbers. Neither do
I need over a dozen different things switching in/out. For that
matter, I've
tried out 3-penny-apiece 1N4148 diodes (100-lot price), plain old
ordinary
old-fashioned silicon switching diodes and they could work just fine
for
4 different HF circuits...but NOT easily for B+ at 100 VDC...and they
need
more circuitry for controlling them than just relay coils needing only
a back-
EMF clamp diode.

But, what the hey, if you are convinced in only your way of doing
things,
fine, go do it. Excuse me, I'm going off-line and spend some quality
workshop time putting some hardware together. QRT.

Sorry, maybe I didn't express it well enough. My point was that not
everyone has a mil budget or a Rockefeller-sized bank account ;-)

Interesting, my car doesn't have that. Now I am curious. What are they
switching in a car where there is no DC current?

As I said this was high-Dollar lab gear. The kind where they don't even
flinch when an engineer says "this needs a piece of rigid coax".

I've served (army), had to deal with radio/telco equipment. Cleaned many
relays there with Emery paper and alcohol. There is a reason for
instructions like this:

http://www.ansaldo-sts.com/EN/AnsaldoSTS/private/private_files/corporate/Mechanical_Relay_Manuals/SM_4560_-_Instructions_for_Relay_Cleaning.pdf

Yep, usually a resistor plus on occasion a choke in series with it, and
enough voltage to be able to be able to reverse the diodes far enough.

Have fun :-)

I am going to have to repair a bench supply that blew its power
transistors way down in there. Not much fun.

Ok, understood, although the ARRL Handbook was "the" eye opener for me as a kid.

But:

```
>
> Len Anderson, AF6AY
> Life Member, IEEE (a Professional Association)
                      ^^^^^^^^^^^^^^^^^^^^^^^^^^
```

Full disclosure: I am also an IEEE member. However, despite numerous efforts by myself and others they could not even get the virtual communities off the ground and with that dreaded web interface they insist on keeping they never will. Now I haven't given up yet and one of the forum admins is also pushing to at least provide a parallel newsreader access. It certainly ain't rocket science. We'll see.

Then the "professional" side of their member benefits such as the Financial Advantage Program or FAP. Yesterday I called for the umpteenth time because a new client of mine wants to see professional liability insurance. The answer: As usual they will decline to quote because part of my job is to design medical devices. The topper was when they told me that the IEEE plan does not cover any work for a company outside the US (this one is) even if we'd exclude medical devices. Almost dropped my water bottle. Is the earth still flat and at the end of the oceans we'd fall off of it? And here I thought they had made it into the 21st century ...

Oh, and when I asked for a homeowners insurance quote a while ago the answer was "no plans available for the county where I live". To be honest, all this doesn't convey too much professionalism.

Sounds dumb, but I'm not surprised. One of the downsides of living in a relatively modern society, I guess.

With the "lead in toys from China" fiasco last year, the lost Goodwills stopped accepting any toys 100%, apparently figuring that many consumers would use them as a "dumping ground" for recalled toys and not have the resources to verify whether specific incoming toys were on the recall list. :-(

Greetings Fellow Surface Mount Construction Enthusiests:

Additional information on my new NimbleSig III dual output AM/FM,
relative phase controlled DDS signal generator/signal level meter
project currently being published in the first three 2009 issues of
the ARRL's QEX magazine can be found on my website at:

http://www3.telus.net/ta/NimbleSig%20III/

Note: The successful completion of this project requires good
surface mount construction skills and tools.

73 & Enjoy!
Tom, VA7TA

It was two books. Boys' [First] Book of Radio and Electronics and

Boys' Second Book of Radio and Electronics.

I learned a lot more from The Radio Amateur's Handbook

You seem frustrated and are Venting about something that isn't even remotely "homebrew." When you pick up on a signature, that is a sure sign you are spoiling for some kind of Fight. <shrug>

I've been getting paid for moving electrons around, guiding fields and waves for 56 years. I've been playing around with a slightly different area of electronics for 62 years as a pure hobbyist, not seeking some kind of fame or notoriety or anything else, just for the fascination of moving electrons the way I'd like them to move. I don't pretend to be an "expert" in electronics or radio...just one who has been around both the electronics industry (in rather different areas, not always of my own chosing) and hobby electronics for a rather long time. I'd thought that more people might be interested in some different ways to do the same circuit tasks, therefore I suggested those from time to time in places such as forums. Obviously not. Too many have THEIR "best way" on things and what THEY do is "so much better." Sigh...

My enthusiasm for electronics got the better of me and, after a long absence of not bothering to post anything in rec.radio.homebrew, I brought up RELAYS as an ALTERNATE way of switching RF circuits at HF. I will apologize for that since I can (obviously) see that some have their "pet" ways of doing things and aren't open to suggestions.

I became a member of the IEEE late, in 1973. Dues-paying kind. Main reason was to add to my WORK knowledge...that which paid for my living.
I did not go into it for any "benefits" package advantages because I had most such benefits already. I am not one to "fall" for professional Advertising (I am a "hard sell" for all salespeople).
Under IEEE association bylaws, Life Membership is achieved solely by tenure, no extra monies involved nor are accepted to achieve that.
On reaching Life Membership, NO dues are required, full membership is free, and members get the informative membership magazine "Spectrum" free every month. It is a Professional organization because it is all about the Profession of electronics. I regard myself as a "professional" for the simple reason of getting paid for work in that field, like that work, like that play (as a hobbyist) and have been doing it for over a half century. I've been fortunate (sometimes unfortunate) to work in several varied disciplines within electronics and got interested in those disciplines. Sometimes the different techniques could apply themselves to hobby activities and sometimes hobby experiments were useful in professional work. There never has been a clear-cut demarkation line of technology between avocational activies and occupational activities except as forced by certain groups within the overall activity.

You will notice a "callsign" in my signature, that of an Amateur Extra class callsign group assigned by the FCC. I did not bother with getting my first-ever amateur radio license until some time in January 2007 and then to pass all test elements on one Sunday afternoon on 25 February 2007. I did that for two reasons: I was able to do it (and had the chutzpah to do so); it was a convenience to have the least restrictions on operation in what MIGHT have been an enjoyable pasttime in my retirement (I still work in electronics but only on my terms (therefore not often) and not in "regular hours." I run into the SAME sort of "I SHOULD have done it <so-and-so>" in nearly every field of endeavor where there are CERTAIN ways that things "MUST be done."

In a burst of enthusiasm, I joined the ARRL immediately after getting my federal amateur radio license grant (one cannot be a voting member without that grant according to League rules). That was another mistake I made. That AMATEUR organization membership is expiring at the end of March and I am not renewing. As a hobbyist, that AMATEUR membership has offered me almost NOTHING in return. I have voiced my opinion on that AMATEUR organization in OTHER forums, to the FCC on amateur radio regulations, and enought that I don't wish to go into it here. Despite having started in big time HF communications 56 years ago, long-time amateurs consider me a "newbie," a "beginner in radio" and that is disheartening, taking away much of my interest in ALL electronics.

In other forums NOT on amateur radio, I have been negatively criticized for being a member of certain organizations that the "expert" critics champion or dislike. For example, the ACM. the first professional association about computing worldwide. NOW, I see complaints about BENEFITS packages of the IEEE not meeting with certain individual's approval. I am not a follower nor an approver of Benefits Packages, nor a spokesperson of any kind for of those. There is very little in ANY Benefits Package that is of "benefit" in ANY homebrew electronics hobby activity. I will emphasize HOMEBREW. Radio. Electronics.

For all my time spent working with, or being hobbyist in, electronics, many and varied "experts" have TOLD me in no uncertain terms that "This is the way 'we' do it in <activity>." I MUST do it as those "experts" say. Sorry, but having been IN the activity for a long time and watching the technology CHANGE, to have NEW ways and components introduced since 1947, I have to throw that didactic insistence (indeed a polemical philosophy) in the dumpster. If someone finds/discovers/innovates something while engaged in hombrewing some radio or other electronics, something NOT normally done but still follows established laws of physics, then it should be, in my viewpoint, be presented for other hobbyists. In the spirit of that being a possible useful thing that others might be able to use in their hobby activity. It should NOT be given in terms of "look what *I* did" as some claim to "expertise." It might be USEFUL to others in their hobby work. I feel that anyone who wants to discuss matters totally different than a forum's intended sphere of interest go find the appropriate forum to vent.

I've learned one more thing in Life here. Do not indicate one's affiliation or pride or other personal feelings in a "signature" of a posting...others do not like that. No matter, my amateur radio license callsign can get my legal address.

Well I got a little 2M nuvistor pre-amp put together last night. Im
not sure of the noise figure of the amp but according to my S meter it
```

```
must have about at least 20 db of gain, maybe 30.

I will have to take it into work were I have the  test equipment to
check it out better.

Jimmie

I wonder... what's to stop them from going beyond children books? Besides, what is a children's book http://en.wikipedia.org/wiki/Children's_books I never did find a suitable definition and for the precocious child it could be anything. And for that matter, what about any pre-1985 book in the vicinity of children. I can see how can this develop over time... handlers of books will slowly avoid any pre-1985 books from fear of liability suits---perhaps even history books printed in the 1940's. Consider the overall results 50 years from now.

Yes... I went through the first, second, third and fourth 'Boy's Book'. I built the crystal sets, one transistor CK722 amplifier, one tube amplifier and Geiger Counter. I wish I could afford collecting those old Morgan books but at $100 or more each forget it. Then there were those countless ARRL publications from QST to the 'Handbook' with those big B&W photos of goregous point-to-point wiring with lead ink that I would drool over for countless hours.

With regard to '451', the theme of censorship has appeared in many novels in widely different plots... but they all express censorship and attempt the control of thoughts and ideas. The CPSC ruling is a disturbing precedent!

Perhaps the digitizing of books may be a safe recourse---but who can be trusted to make the selections of what to digitize, who will maintain and oversee electronic libraries?

Anyone know what kind of noise figure I could expect out of a 6cw4
nuvistor preamp. I only saw one reference and it mentioned 3db but
mostly all the other references just talked about gain.

Jimmie

For what it's worth: I used to have terrible pager-intermod problems with my Yaesu VX-5, when used with any reasonably-efficent antenna (e.g. J-pole)... pager-transmitter intermod drove it wild. This seems to be a common problem with most current-generation HTs, with their wide-open "DC to daylight" front ends whose high sensitivity (for use with lossy rubber-duck antennas) leaves them prone to being badly blasted by strong signals.

The solution I settled upon was the PAR Electronics VHFTN152-158, a notch filter specifically tuned to eliminate the VHF paging band, while passing other signals. PAR claims a notch depth of 50 dB (typical) at pager frequencies, with low loss at 2M and 440 frequencies. From the look of the filter, I believe it's probably a set of three helical resonators shunted across the line.

Problem solved - the VX-5 suffers no pager intermod at all that I can hear.

The same filter did *not* help, though, in curing a desense problem with our repeater's remote-link receiver, which was being blasted by a newly-installed paging system located in the same building. The pager was operating up in the mid-160MHz range, outside of the PAR filter's notch. We installed a DCI cavity-bandpass filter and the problem went away.

In re the OP's problem - I wonder whether it might be possible to home-brew a moderate-Q helical filter to serve as a notch? The old ARRL VHF handbook has some diagrams of this sort of thing. As Tio points out, one might not need all that deep a notch to result in an acceptable reduction in intermodulation and desense.

Hello folks,

I read with interest on this web page http://blog.marxy.org/2009/01/amazing-transmitter-that-uses-atmega16.html about an article in WIA's Amateur Radio featuring a 10m FM transceiver design using an AD9851 and an ATmega16. Does anyone have a copy of this article (and the software to go on the chips) so I could have a look at it please?

73

John

I've found that for RF below 2m, about any really will work within
reason. Bad relays to use are reed relays or any relays where the RF
leads are wrapped or parallel with large surfaces. Yaesu and Icom use
smaller DIP based relays just like the ones at radio shack. I would
simply calculate the current at the power level you need and use the
appropriate relay. I use "KP" relays all the time. even in the 2m band.

I've got this antenna:

<http://www.hdtvprimer.com/ANTENNAS/cm4228.html>

From my location the 2 largest DTV transmitter clusters are approximately 60 degrees apart.

How effective would it be to modify this antenna such that each of the 2 bays pointed to each transmitter cluster?

Yes, I know it's probably best to buy 2 antennae and couple them, but funds are really scarce and I've got time on my hands.

1. Would it work?
2. What are the practical down-sides (engineering blasphemies aside)?

I know this is not an elegant solution, so if your only comment is to say this, please resist.

Thanks.

I'd think you'd really sacrifice the VHF hi-band coverage if you
do so. Do you, or will you, have and digital stations that will
remain in the VHF band?

Can't find an old Tenna-Rotor for cheap? Me neither.

Hate to suggest hacking up your antenna but sure, I think you could 'bend' it down the middle 60 degrees and accomplish that.

In the analog days that might have resulted in terrible ghosting but the latest 8VSB technology can operate even with a multipath signal at 1-2db down.

(That also means that if you have a 2004 vintage DTV or DTV converter it might not work if multipath comes into play)

Second idea. If you are in a fairly strong reception area why not simply build a pair of homebrew antennas before hacking up your good one? There's some plans on the web, one notorious one is on YouTube with DIY instructions.

-Bill

I think hacking an antenna so that half is pointing in one direction
and half 60 degrees awy would be worse than just pointing the antenna
half way between the two TV clusters.

Well, if funds are tight, and you have time, build two of
these antennas designed by Kent Britain. They'll work
better than the antenna you cited (for UHF), and also
have the benefit of being 75-ohm impedance.

hacksaw the top and bottom angle bars to just break the lip that
extends out from the mast (rather than lays against the mast).

Bend the angle bars and screen 60 degrees along the length of the mast
so that each side points towards the separate transmitter clusters.
(Giving the appearance of a ship prow pointing halfway between the two
clusters.)

Effectivity? You lose up to 3dB gain; your nulls fill in somewhat;
you don't spend any money.

Check out the 6CD6, 20 watts plate dissipation; max plate volts 700. The 6DQ6 is a similar tube but onlt 18 watts PD but handles 770 volts. The next step up will be novar/duodecar compactron color TV sweep tubes which can be expensive due to the explosion of sweep tube CB linear amps in past years/decades.

Why not just design it around a 6146?? Easy to find--and maybe free from another ham.

Best 73.
Russ

If I DIY, I'll need only one; I'll keep the 4228 and couple it with the DIY.

How do I couple two antennae onto one cable?

Thanks.

If you can stand a loss of 3dB, I reckon that should work OK.

As you increase the angle between the two parts of the antenna, the
presently 'pointed' polar diagram will broaden and flatten, then it will
start going heart-shaped (with an increasingly deep null in the centre).
The only downside is that, when you are looking at one transmitter, you
will be picking any reflections coming from the direction of the other.
But, being digital, you will probably get away with it.

Just one point: I'm wondering if, for the highest gain towards each
transmitter, the bend should be 60 degrees - or maybe something a bit
more would be better?

TV splitter.  Any place such as Best Buy, Wal Mart, Radio Shack should
have them.  Normally used to split one antenna to two TVs.  Just reverse
it and put it up by the antennas.  This will "combine" the two antennas
and send the signals down one coax to the TV.

If it had been for analogue, I would have said no, no, no, no, no, no - never EVER use a wideband splitter to combiner two antenna feeds. When you are looking at one transmitter, you will be picking any reflections coming from the direction of the other. However, as this is digital, you may get away with it (just like bending the antenna to obtain two lobes).

However, you are far, far better off with a separate feeder and a 2-way A/B switch. They are only a few dollars each.

"Essentials of Radio" by Morris Slurzberg and William Osterheld.
McGraw-Hill Books; 1948; Hardback; 805 pages

Introduction to radio
Circuit analysis
Simple receiving circuits
Vacuum tubes

Detector circuits
Tuning circuits
RF amplified circuits
Audio-frequency voltage amplified circuits
Power amplified circuits
Vacuum-tube oscillator circuits
Power supply circuits
Audio units
Transmitting circuits
Receiving circuits
Test equipment
and 18 sections in the appendix.

This was written and published when books were made with quality.
It's in excellent condition. No writing inside other than my name
stamped inside the cover.

Realize this was written in the "vacuum tube era".

$25 + shipping.
Shipping will be "media mail" via U.S. Post Office.
That's the cheapest rate for books.

Please use Reply to Author when responding.
That will get the fastest attention.

Better in the sense of being there to throw the switch, maybe. But I've got a programmable-event DTV converter box which allows me to record shows automatically. The antenna set-up needs to be automated.

Thanks.

Some DTV converter boxes support the CEA-909 or CEA-909A "smart antenna" interface, which allow a command to be sent to the antenna to change the antenna's behavior (directionality, frequency setting, etc.). A good DTV converter will identify the best antenna setting for each channel (I imagine this takes place during the initial scan-for-channels process) and will switch the antenna system each time it tunes to a new channel. In CEA-909A, the signalling can be

done over the same coax cable which carries the antenna signal; the
older CEA-909 requires a separate control cable.

Not all converter boxes support this feature, and of course you need
to have an antenna which has Smart Antenna support.

Unfortunately, the Smart Antenna specs are not freely available... a
hardcopy or download version costs somewhere in the neighborhood of
$70. I don't know if anyone has reverse-engineered the data format.

!!!

Well, if you put a smallish bend in the antenna of (say) 10 degrees, you will still have one lobe, although it wider and the gain will be lower. Only when you increase the bend to (maybe) 20 degrees will you start to get two separate lobes.

I'm somewhat guessing, but I reckon that the angle between the two lobes will continue to be less than the angle of bend until the bend is considerable - and possibly more than the 60 degrees between the transmitters. Eventually, the angle between the lobes will 'catch up' with the angle of the bend - but maybe only when the bend is a full 180 degrees.

So, for the two lobes really to be 60 degrees apart, maybe the bend will have to be (say) 65 degrees? What do you reckon?

Hi Ian,

That sounds more reasonable, but I would suspect that when the hammer
is swung, that 5 degree slop will par for the course. It will take
more sophistication to peak both clusters independantly to prove your
point, but it could well be.

I thought I wasn't talking total rubbish (like I usually do).

Unfortunately, I've just spotted a problem with bending the antenna. If
you cut partially through the two angle bars to weaken them, and then
bend them and the reflector backwards by 60 degrees, the 'feeder' which
joins the two halves of the antenna will have to be stretched - and you
won't be able to do that. You would have to replace it.

Nah... It would be silly to ruin a handsome antenna. Far better to put
up a separate antenna and feeder, and use some sort of A/B switch at the
TV end.

Hey OM
I guess nobody here is a youtuber? I seen on youtube a guy has a 4 bay
bow tie, shows how to make one for chump change. Like 5 steel wire
coat hangers and a 2 ft 1X2 and some screws, and a balun transformer.
I saw it on youtube he makes a 4 bay bow tie antenna in under 5

minutes. It doesn't have a screen reflector, it's more like
bidirectional, well almost.

You can't; one is 75 ohms and it looks like the one you have
is 300 ohms. You'd need a balun on the 300-ohm bowtie antenna to
make it 75 ohms, and then use a TV combiner/splitter to
combine the two antenna feedlines down to one single
feedline.

Pete

I don't see that one, but this one has several possible configurations, one of which includes multiple bays aimed in different directions:

<http://www.youtube.com/watch?v=Y0m6AfR-9As&NR=1>

Thanks.

Umm .....

I've skipped through the video, so maybe I've missed one or two key
facts. However:
1. Are there three identical antenna, each pointing 120 degrees apart,
each with its own feeder, or
Are all three combined to make an approximately omnidirectional antenna?
2. The reflector seems to be far too close to the active elements. I
would have expected it to be a quarter wavelength away.

Sorry, that was a little American-centric comment (must remember: Imperial Measurement System is not universal...)

The most basic standard lumber used in construction in N. America is the 2x4 stud (2 inches x 4 inches cross-section, available in 8, 10, 12, 16, and (I think) 20 foot lengths).

This is what the guy building the antenna is using as the structural wood members.

Dave

Hi,

I have created a Smith Chart Tutorial located here:

http://www.fourier-series.com/rf-concepts/smithchart.html

It is comprised of flash programs with embedded audio. It allows you to learn the smith chart through the interactive nature of the flash program.

I The tutorial explains the smith chart, allows for capacitive/inductive matching and introduces how a transmision line affects the reflection coefficient and how to use transmission line stubs as matching elements.

Good Luck with this

Brent

Actually, dimensional lumber has shrunk over the years just like candy bars and dollars. Only in very old houses will you find 2 X 4s that are 2" X 4". I'm getting pretty geezerly, and it was before my day -- they were down to 1-5/8" X 3-5/8" at the earliest I can remember. Now a "two-by-four" has shrunk to 1-1/2" X 3-1/2". When they get down to 2 X 4 cm, we can finally go metric without having to do any conversions. Maybe when they get down to 1/4 X 1/2 inch they'll get revalued like a peso?

Roy Lewallen, W7EL

Well, surely 1.5 inches is nowhere near enough? However, I suppose it
preserves that nice slimline look.

What are the critical dimensions? If one wanted to use better materials
(plastic rather than wood for the base; aluminum tube rather than wire), how
does one calculate the dimensions?

I mean, "about 2 inches down" and "about 5-3/4 inches between elements", and
"tips about 3 inches apart" are the results of some calculations. What are

the calculations that determine these dimensions for this style of antenna?

Thanks,

All dimensions will be approximately +/- 0.001".

Seriously, when the antenna simply gets dumped behind the TV set, do you
really think that any of the dimensions will be very critical?

If one were to build something to better specs, with better materials, in a much better location (not dumped behind anything)?

I presume there's antenna design formulae that result in the proper dimensions for this type of antenna. Where can I find this information (preferably on-line)?

With my Google criteria, I don't find much that's useful.

Thanks.

The following may be useful:

   http://www.digitalhome.ca/ota/superantenna/index.htm

Single- and double-bay Gray-Hoverman UHF antennas, which can be built
using either of several styles of reflector - a full screen, a split
screen, or a set of collinear rods.

When I lived in the Air Force barracks a guy bought a very similar
antenna at Radio Shack. This was after cable had been removed because
so many people were stealing it.
Anyway it didnt take long before everyone started building their own
antenna copied from the RS one. The stock of brazing rods at the
motorpool was depleated very quickly.

Funny thing, I was accused of stealing cable though I wasnt hooked up
to it. I was able to demonstrate to the First Sargent that I could
receive Cable TV just off of the leakage from the system and argued
that the Cable company had the responsibility to prevent radiation
from their equipment. He agreed. What I learned was  really happening
was that the guy in the room next to me had his rabbit ears connected
to the cable input of his TV  and was broadcastinig it. About 10 rooms
could clearly pickup the signal from this. Unfortunately several
people had simply made illegal connections to the cable system. I
understand that the same thing is happening now with internaet service
```

in the barracks. My nephew tells me that it has been forbidden to have
a wireless router in the barracks for ths isame reason.

Jimmie

I see the 300 ohm feedpoint for the single bay but the double bay is a
little different. I can see something's attached to the two bars that run
vertically and join the antennas (in the photo that shows the double bay
with PVC frame), but I can't tell if there's a balun there. Do we know what
the impedance is at that point?

I may need to try reaching the people who did the web page. Thanks.

Given that the presumed bandwidth of the antenna ranges from 470 to 700
Mhz (not counting any VHF bonus) I figure there's no specific impedance
other than 'ballpark'.

I don't think there's anything wrong with the materials. It's basically
a sound design. It's just that (unless I'm very much mistaken) the
elements need be around a quarterwave in front of the reflector (more
like 6 inches instead of the less than 2 inches shown), and you need to
mount the antenna 'in the clear', and point it towards the transmitter.
Obviously, with these materials, the antenna is best suited to mounting
in a loft, provided that the roof tiles and lining are adequately
transparent to UHF RF.

==============================================
Here in Britain it is illegal to 'tap' an individual's or
organisation's/company's Wifi for Internet Access without permission,
however with consent of the Wifi router  owner it is permitted.
I know that for example in the Netherlands (usually large)houses are
often occupied by up to 20 students . With 1 Hi-speed /unlimited
download (A)DSL connection , they all share that 1 connection.
They don't need an e-mail address from the ISP but have one or more from
Google or Yahoo .

If I had a neighbour close by I would be happy to share my connection.

M.T.09.05-08.Tanskan insin��riliitossa uskotaan uusiutuvaan energiaan "Energiasuunnitelma 2030"- nimisen raportin (ES). Sen tekoon osallistui 1 600 insin��ri� ja muita energia-asiantuntijoita. ES:st� sijoitukset uudisenergiaan ovat ekologisesti ja taloudellisesti hyvin perusteltuja. Samoin varteenotettavia vientimahdollisuuksia. Uudisenergia tulee rajusti lis��ntym��n. Tanska p��see v.2030 pitk�lle kokonaan uudisenergiaan. Arvellaan 50% osuutta jo silloin.

Kasvihuonep��st�ist� poistuu 60% ja n�in s��styy 15 miljardia kruunua/v. Investointitulojen kasvuksi 30 miljardista 160 miljardiin v-30. S��st�� 845 petajoulesta 580 petajouleen. Suomessa 1 400 petajoulea. Teollisuus voi v�hent�� 30%! S��st�� t�st� 6 miljardia kruunua. Takaisinmaksuaika investoinneista 6-7 vuodessa. T�h�n budjetti 107 milj. euroa. Rakennusten energiankulutuksen puolitus 2030. 15% tulisi aurinkoenergiasta. S�hk�st� pois 40%. Jo 2020 j�lkeen rakennettavien talojen arvioidaan olevan JO energianeutraalin. Energias��st�s��ti��n pannaan miljardi kruunua.

Liikenne Tanskassa viel� kasvaa 2%/v. Siit� tullaan poistamaan 20% nykytasosta korvaamalla siit� biopolttoaineella. Viidennes s�hk�autoihin. Rautateille lis�yst�. Verotus suosimaan ymp�rist�yst�v�llisi� autoja. Kuljetuksiin 200 miljardia kruunua l. 27miljardia. V�hent�en terveydenhuoltoa, ruuhkien ja ymp�rist�nsuojelun menot. Huomattavasti nykyist� suurempi osuus uusiutuvista l�hteist�. Tuulipuolella Tanska suuntaa merien offshoretuulivoimaan. ES:n tavoite on kaksinkertaistaa tuulivoimaansa s�hk�st� huikeaan 60 prosenttiin!!!

Aurinkosoluille 2030 ennakoidaan 2% ja aaltovoiman 5% s�hk�ntuotannosta. Aaltovoimaa pidet��n eritt�in merkitt�v�n�. Biomassasta ennakoidaan 30% v.2030. Mukana biopolttoaineiden 20%. Biokaasuun luotetaan, samoin uuden sukupolven biopolttoaineisiin. N�ihin Tanska sijoittaa paljon. Biopolttoainesektorikasvaa 20 miljardiin kruunuun 2,7miljardiin euroon. Kolmannes 2030 voimaloista k�ytt�� jo tehokkaita polttokennoja ja l�mp�pumput ovat arkilaitteita. Tutkimuksiin nostetaan 350 miljoonasta miljardiin kruunuun. Valtio kevitt�� uudisenergiainvestointiriskitt�m�mpi� sy�tt�tariffeja. "Saastuttaja maksaa periaatteella!"(Suomessa ydinalalle moinen olisi ennenkokematonta!)

Suositellaan luopumista verotuksesta joka est�� siirtymist� fossiileista uudisenergiaan. Lentopetrolille veroa. Tanskassa on oleellisesti helpompaa toteuttaa uutta energiapolitiikkaa. Valitettavasti meill� ei edelleenk��n olla valmiita sellaisiin toimiin, joilla kokonaisenergian kulutus saadaan selv��n laskuun ja uusiutuvan energian ja sit� tukevan teknologian k�ytt� vahvaan nousuun.

U.B. Linstr�m kehitys- ja ymp�rist�kysymyksiin erikoistunen professorin yleis�osastokirjoituslyhemnelm�.

Thanks Scott,
I have contacted RF Parts who inform me the transistor is now obsolete and so is the equivalent.
Does anyone know what the equivalent is to the 2SC2509 so I can search for that too?

For those still interested I found that Delta makes a non ferrous
blade that sells for about $25 USD.

>that too?

It looks as if ECG236 is one possible substitute, and 2SC1945 is
another. You might also check out 2SC1969 and MRF-485... depending on
your application they might work. Kenwood apparently recommends the
2SC3133 as a substitute in the TS-450.

The lead configurations for these substitutes may be different and
require lead-swapping, and other parts changes may be required when
using substitute transistors.

Beware of possible fake/forged/counterfeit parts.

I believe I've seen some mod workups for CB rigs, which substitute an
entirely different sort of part (e.g. the IRF510) as an RF driver or
final. Using the IRF510 or similar MOSFETs as RF finals requires
substantial circuit modification, and from what I've heard the
efficiency is likely to be poor if you're driving them from a 12-volt
supply.

Jimmie

Very interested. What size blade, and how does it cut aluminum?

Pete

Crap.  Sorry about that :(  Is everything obsolete these days such that
nobody can build anything anymore?  I was going to make another 222
transverter from W1GHZ, but the stupid helical filters aren't available
anymore (I think Digikey still has some but they want $48 each for a 222
  three pole filter.  That's nuts!  So, I have a blank board and I'm
going to try to make a simple filter and see if I can make it
work...I've been "build crazy" for the past couple years and it's
getting harder and harder!  You have to pretty much build something very
soon after it appears in a magazine or some part will go obsolete and
you're stuck...

Scott

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT

Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Look at his feedback before deciding to bid.

From my standpoint, he has stupidly excessive shipping for transistors.

```

The original charger inside the orange coloured stand is just a
transformer with an 'embedded' diode ,rather crude .
I have removed the transformer , fitted the stand on top of a small
plastic enclosure in which I have put a transformer with 12V output , a
rectifier and a LM317 with appropriate resistors and a switch for a
constant charging rate of 300 or 10 mA .

Frank GM0CSZ / KN6WH   (back in GM land)

Hi

I need some HC6/u ceramic xtal sockets and the
metal clips that hold the xtals (and ground them.)
I'd be happy just to find the CLIPS, as I do have
a resource for the sockets. Can anyone help
with clips (with or without sockets..)

Pete

Hi Pete,
You could easily make your own out of 1/4" strips of phosphor bronze- Small Parts or K&S Engineering may carry the strips.

Dale

Blade is 10 inch, fits my chop saw , radial arm and table saw.
Ive used it to cut Al tubing and some square bar stock and it seemed
to do a good job.
I tried it on some Al sheet metal and it did pretty awful. I think
this has something to do with the alloy more than the blade. I have
always had trouble doing anything with this piece of stock. It binds
up drill bits in a second.

Jimmie

HI

Also try http://www.jabdog.com/semi-tra6.htm for 2SC1969 while stocks last.
Sadly no 2SC2509s though.

Watch out though. Looking on http://www.modecomponents.co.uk/ under the
Transistors section it states:
Due To Mitsubishi discontinuing the below devices and so many
fakes on the market I am no longer stocking them. 2SC1969 is one of the
listed items.

Suggest you go to www.mods.dk  ; there you'll find the instruction
manual for this transceiver;   look for : manuals: Icom ---> 765

Hello all of you
I am in the process of completing the "power supply of my dream".
One of the problem i meet is the meetering.
I would like to use a digital voltmeter (those with red led). I
alwready use the LCD volmeter but i dont like them. They are way too
much sensitive to static, they dont really produce a bright display
and they dont seem to like to have volt on their input when they are
off.

Does anyone could point me to some kit for that purpose.
I have room on the face plate for two of them (5 cmx2cm)

I am not sure the second one for amp would be usefull. Amp change very
rapidly and maybe there is another way to measure them.

INDCON =9209   March 12, 13 & 14

INDCON is flagship event of the Department of Industrial Engineering, Anna University, Chennai. Having its roots in the early 90=92s, INDCON has stood the test of time among the plethora of college symposiums. Among the usual events like paper presentations INDCON has always fostered innovation through events like PRODOMANIA, INNOVATE among others. This year it is being planned on a massive scale, with huge prize amount and a staggering number of events, the main focus being on having something for everyone who participates in the symposium. From the really technical events to the =91Letting your hair down=91 events like SHOWDOWN and events for the part-time students, we have made sure that no one is left out.

CONCLAVE =96 For the first time in INDIA a conclave of Industrial Engineers experts from all over the country will congregate at the IE CONCLAVE to share their thoughts on emerging IE trends. This event is expected to be a huge hit among the research scholars.

PRODAMANIA =96 Prodomania is design and present event which endeavors to challenge your designing skills to come up with new products /ideas and stimulates your creative ability in coming up with improvements for existing products.

INNOVATE =96 Combines =91Contraptions=92 with =91Rumble in the junk=92 will

surely set the adrenaline pumping in the hearts of its participants
and the viewers alike.

INDUSTRIAL STRATEGIST =96 For all you management geeks out there this is
THE event to be in.
An interesting array of Quizzes are also being lined up and the word
is going around that even die hard Quiz buffs are going to find these
ones a hard nut to crack.

Check out www.indcon.ieceg.in for more details.

List of events :
=95 Prodomania
=95 IE Conclave
=95 Industrial Strategist
=95 Paper presentation
=95 Innovate
=95 Biz quiz
=95 Quality quiz
=95 Math quiz
=95 Black Box

This is with regards to a medium-power (~50W) CW transmitter that I am
building for 40, 20, 15, & 10m. I would like to use relays to switch
the output filters, but have no idea what kind of relay I will need.
Dr Sabin mentioned that a high-quality relay is required (http://
www.google.com/url?url=3Dhttp://groups.google.com/g/d5a7ff03/t/3d5e036fddd0=
24eb/d/355b6c8e64361096%3Fhl%3Den%26ie%3DUTF-8%26oe%3Dutf-8%26q%3Dsabin%2Br=
elay%2Bband%2Bfilter%23355b6c8e64361096&ei=3Du-SaSdCSGIOU-wGVlcGnBQ&sa=3Dt&=
ct=3Dres&cd=3D1&source=3Dgroups&usg=3DAFQjCNHG7VKozzInElLsIi0baYXpyphcAw
) but I have been unable to find anything specific. Could anybody
please direct me to a resource that would help me answer this
question? Thank you very much.

For reference, the transmitter is a redesign of the classic '60s
"inexpensive 75W transmitter", originally by Lew McCoy (I believe),
one version of which can be found at (http://www.mines.uidaho.edu/
~glowbugs/inexpensive75wattxmitter.pdf ). It is a simple crystal-
controlled 6AG7 followed by an 807 amplifier at 75W input (<50W
output). The filters are from Ed Wetherhold's article- (available at
http://www.arrl.org/tis/info/pdf/9902044.pdf ) 7th order "Chebyshev
With Added Zero" to give better second harmonic attenuation.

Best regards,
```

LCD displays may be more viewable than LED in sunlight.

LCD displays are available with backlights for use in dim environments.

There are both LCD and LED panel meters available but they use very similar chipsets so I'm not sure "too much sensitive to static" would be true for one but not the other.

> Does anyone could point me to some kit for that purpose.
> I have room on the face plate for two of them (5 cmx2cm)

Go to Digikey and search for "LED panel meter".

> I am not sure the second one for amp would be usefull. Amp change very
> rapidly and maybe there is another way to measure them.

For rapidly varying quantities nothing beats a good old analog meter.

For slowly changing quantities you need to know to 4 decimal places
nothing beats a digital meter.

Sometimes digital meters are supplemented with a bargraph type display
to show rapid changes graphically.

> With Added Zero" to give better second harmonic attenuation.
>
> Best regards,
> Ross, NS7F

My friend used to do something similar at the antenna and using SPST
contacotrs that were used to switch an air conditioner compressor on
and off. Three of these could easily fit under a Pi-net coil. Ill try
to find picks and part numbers.

Jimmie

Finding the multi- section caps may be impossible. A local parts
dealer had some long skinny caps I bundled 3 of them together with
heat shrink for a replacement.

They were at Slayton's in Charlotte NC. Parts like that come and go
there and they often dont know what they have unless its regular
stock. Its a great place to browse on Saturday mornings.

Buy new ones. Small, fresh axial and pc mount 160 to 450v. I was surprised
how much smaller than the originals.

Hank

Check www.dialcover.com.  Bill Turner makes look-alike
replacements in several values. They are good if you want
to keep the underchassis appearances. Otherwise, use
discrete axials.

Pete

Has anyone here ever built a RX or TX using the Norcal FCC-2 DDS kit?
I've just finished building the kit and it worked on the first try. I'm
planning to use it as the LO for a multi-band version of the KK7B R1
direct conversion receiver, then will probably add TX to it later. Just
wondering if anyone had any experiences with this kit that they'd like
to discuss. I'll post my findings here in the coming days or weeks.

Norcal did a nice job putting together the FCC-1 frequency counter kit
and FCC-2 DDS kit. Thanks Norcal!

73,
Joe K9LY

===================================
Suggest you look for good electrolytic caps in scrap (not too old) PC SMPS units . I have removed quite a few of adequate capacitance and working voltage to be used in valve (tube) type radio ,assuming AA5 radios are of the tube variety.
When removed from scrap equipment , it is best to slowly cycle them (charge/discharge) a few times up to the stated working voltage .
If necessary test them in a real equivalent circuit and check ripple with a scope . A bit of work ,but imho a rewarding activity.

```

I recently acquired one of these cheap 2m handhelds from China, an FDC-150 I think. It's great for the price (=A330) apart from a problem with QRM.

I use the radio with a 3 element beam from SOTA activations from hill tops. It varies from location to location, but I often get strong intermodulation effects (caused by pagers I think). I suspect the radio, being wide band 136-174MHz, has insufficient filtering to reject these strong signals.

```
The intermod is a real problem, as I am often unable to hear stations,
or only get half of what they are saying before they are wiped out. I
was wondering about building a 2m bandpass filter like the one at
http://www.arrl.org/tis/info/pdf/0005054.pdf

Does this look like a good bet?
Also any ideas where I can get the semi-rigid coax (UT-141 or RG-402)
in the UK?

Try Westlake, if they don't have it they may point you in the right
direction.
http://whwestlake.110mb.com/

A simple helical filter as fitted to some of the early Japanese ham band
only sets may be a bit more compact and still have enough rejection of
out of band signals as most of the pagers in the UK are around 153 MHz.
I use one scavenged from a scrap Icom IC22 but most of the radios from
that era used them.

This kinda agrees with what Steve posted...

First, if you want to build it, there's no reason you have to use semi-rigid. It should work fine with any reasonably low loss coax if you adjust for velocity factor variations from the design-specified coax.

But...if you have a way to tune an LC filter, you can make a more compact filter using coils and either explicit capacitors or the distributed capacitance as in a helical resonator. Using RG-59 size coax at 150MHz, you'll get resonators with an unloaded Q about 100 -- and it takes a piece of line about 40 cm long to do it. You can get well over twice the unloaded Q from a coil only about 6mm diameter and 6mm long. Higher unloaded Q allows you to build sharper filters and/or filters with lower insertion loss. Coaxial stub filters make sense--a lot of sense--at GHz and higher frequencies, but unless you want to use really large diameter resonators for something like a repeater duplexer that requires seriously high Qu, you're probably better off with an LC filter at 150MHz. If you don't have access to equipment to tune up a home-brew filter, use of a pre-tuned filter like the helical resonator Steve suggested is a good idea.

Cheers,
Tom

If you are right about it being from a paging system the problem may
have nothing to do with the quality of radio you have. I have
experienced the same thing with a cavity filter on the front end of a
rx. Often the problem is with the pager transmiter. In that case no
amount of filtering will help.

Hey OM
I don't think it's all about static per say. But the high input
impedance you have to worry about I seen those things going up to 200
meg input, just looking at it would change the potential across a 200
meg input.
There's other cons about LCD like if it gets cold forget it, those
liquid crystals just don't want to do their thing, when exposed to the
energizing electric field at low temps. Sure you can get back lite
LCD's but what happens when the back lite burns out?
I like LED displays but even then you are going to want to swamp down
the meter input with like 1000 ohms.

>>Jimmie

Sad but true. A cavity the size of a backpack might only give you 30db of rejection, but you might need more than 60db of rejection and you could never get that without putting the radio in a sealed di-cast box with bypassed power and audio. It would certainly be better though to start with a RX module with some isolation. The fact is, that scanners and cheap HT's might be rated at -40 db to -60 db of alternate channel rejection and get blasted by everything on the mountain as well as everything on every other mountain within 20 miles too!   This is only a published spec. and doesn't really tell you how much actual signal will result in overload of your RX deck to cause Desense, nor does it guarantee that something else won't cause a mix that falls right on the frequency you want to hear!

Or you could start with a top notch commercial RX deck with -90 db or better and hope you can work on that.

If your problem is -only- paging TX, say 1000 WERP or +60dbm and you can stand right under the tower (for maximum vertical separation) you might have at least reduced the energy at your antenna to 0 dbm but more likely +20 dbm. Now you will have to notch out the offender by 140 db more to render it truly invisible. Rotsa ruck, but if you had a radio with a 5 pole helical resonator and Hi level mixer, you would be certainly better than with a scanner, which would be like sending a baby in to fight the fires in the Twin Towers.

If the interference is the result of a third order IMD product,
each 3 dB of rejection will yield a 9 dB improvement in the
third order intercept point.

A modest filter might yield surprising results, it isn't a linear
relationship.

Might have just what you need... it's somewhere in the back of the mind...

Some years ago John Regnault G4SWX was experimenting with various kinds of filters using coaxial stubs. Many of the most useful ones were published in Radcom and found their way onto my 'In Practice' website:

http://tinyurl.com/g4swxfilters

One of John's ideas was a filter with notches just above and below the 2m band, specifically to knock down the strong carriers from pagers. It only needs two pieces of coax and two small trimmers.

The idea starts with an open-circuit quarter wave stub which is produces a notch on the pager frequency, above or below the 2m band. To make it field tunable, the stub is cut a little short and a small trimmer inserted in series with the hot end. The only problem is that such a stub will produce a mismatch at 145MHz: a stub that is resonant above the band will appear capacitive at 145MHz, while a stub resonant below the band will appear inductive.

These reactances can be compensated by a shunt inductor or capacitor, but G4SWX's bright idea was always to use *both* stubs - regardless of where the pagers are - and let them compensate each other.

Some work with an optimizer was needed to produce the best design, which proved to be quite tolerant of practical variations. We had an article almost ready for publication since 2002, but didn't go ahead because it seemed like "a solution waiting for a problem" - until this week.

A copy has been e-mailed to the OP, and if it works for him we will publish it.

Thanks for the advice everyone has given.

I've decided to give Ian's solution a try when I get the relevant
lengths of coax and trimmers in a week or so.

I'll report back when I've built it.

Hey OM.
I used to make a living selling Mallory capacitors. Mallory came out
with a book called the Bird's and Bee's of electrolytic capacitors.
Well the electrolyte in these capacitors does dry out, but not from
sitting around in room temps. The electrolyte dries up from discharge
and charge, each time of a charge or discharge cycle the electrolyte
breaks down, into gas, that's why they have to be vented, or they
would explode. The electrolyte also dries up if you heat them up. In
the old days they used a lot of electrolyte.

So why don't they have capacity? The electrolyte in old style
capacitors has lots of room in between the plates and seperators, and
with time the electrolyte settles via gravity, At this point the
plates are no longer fully covered with electrolyte so the capacity
goes down the crapper.

>When removed from scrap equipment , it is best to slowly cycle them
>(charge/discharge) a few times  up to the stated working voltage .
>If necessary test them in a real equivalent circuit and check ripple
>with a scope .  A bit of work ,but imho a rewarding activity.

>Frank   GM0CSZ / KN6WH

^Is right for the most part, the key really is to ramp the voltage.
from 0 to full rated WVDC, up slowly, real real real slow, like days
to a week, this will wick the electrolyte back up on the plates and
once again the capacitor will be usable. So a NOS capacitor off the
self at room temp can be brought back from the grave

"Surprising results" in a lab maybe. Still far short of real. An attenuator would tell you how much you really need. I used to use an HT with a dummy load instead of an antenna from Mt. Wilson to be able to talk into a box on Santiago Pk.   Otherwise the HT couldn't even hear 500 WERP on-channel from the tower I could see with my own eyes. Be aware that you might only have 30 to 60 db of bolt on attenuation before case or cable leakage takes over.

I used an Alinco 2m HT with a two section helical resonator outboard (most portable solution). There was 3 db of insertion loss and 20 db of rejection outside of a 3 Mhz window. This was a packet radio and resulted in a 10db improvement in performance on-channel, but this was a home station on a 6db stick 20 ft in the air. Would have been far short on a mountain though. I aslo used that combination for T-Hunting in addition to a fixed 60db pad and a switched 20/20/10db pad with double shielded coax and 4 el. Quad. My best solutions was to find places to listen from that were shielded from the major mountain tops.

Sorry. I was visualizing the 1200 ohms each in series with the transformer, whose center tap is grounded.

Of course the alternate way makes perfect sense.

And here it is too late to ask Santa for more brains for Christmas.

Would that make a difference?  I'd also assume there's two RF cathode
bypass caps in there; otherwise the circuit would be extremely
degenerative.

Pete

Dear OM,
TU. An original post was on the XMLog group and it took a long while, in my estimate, to get a response. However, I got a couple of suggestions and an explanation which involved the sending of ASCII characters.

I don't mind asking questions that might be perceived as dumb. (Just look at my history of posts to various groups. Many years ago I created quite a stir when I asked a question about a Beverage antenna, hi hi.)

So, to all the helpful and compassionate Ops, thank you very much. Over the years, I received a lot of help from the many groups on which I posted.

73,
Evan

So long as the inductance of the resistors doesn't resonate with the
bypass capacitors at some frequency of interest.

But would the impedance ever be lower than the ohmic resistance
for the resistor?

Last year I gave my wife a shirt that said "if you're not part of the
solution, you're part of the precipitate." (She's a biologist) and my son
got "I'm as [Gaussian distribution equation] as anyone," both from
Thinkgeek.com.

I saw plans for a one-button Morse Code electronic combination lock once,
but never got around to making one.  Also, it would be nice if someone made
a Java ap. that allowed text entry via Morse code.  My daughter can type
fast and accurately without looking using T9 on the keypad, but I always end
up with the wrong ambiguous word (e. g. "good" in place of "home") in my
messages.

Right again, Ken. Those ARC-5's were sure a lot of fun when new ones
were $5 a crack! Used one for VFO on a BC-375 when the'375 was
$45, new, complete with all tuning units, dynamotor, antenna tuner,
antenna switch with RF ammeter, etc! Glory days of radio. If one didn't
mind a little "yoooooop de yoooop yoooop" on CW, the 211 in the
'375 in MOPA mode made a nice oscillator tube as well!

Old Chief Lynn

I agree Ken. A lot of the early 30s rigs used a tetrode driving a 45.
I'll have to dig deeper. (Looking for retirement projects!)
I saw a neat design using a pair of 30s to drive a P-P pair of 33s in
one battery TX QST ran in 32 or so.

Pete

Hmmmm...You think class A at RF requires no driving power??

Cheers,
Tom

Only voltage, no current.
Of course some power gets wasted since resistance isn't zero and some
heat is generated in the coils, etc.  I guess there is some power factor
in the grid / cathode capacitance etc.  The input impedance of the '45
in class A SHOULD BE infinite.  It isn't, but it IS VERY HIGH.  So
except for losses, no driving power, only voltage.

The 27 is an indirectly heated triode.
Except for the Kellog tube, it was the first one ever made.
(not talking prototypes though).

The 24A is a tetrode. Than might make a nice xtal oscillator to drive
the '45.

Hey OM
In the old analog TV days I used a cable ready varactor tuner as a
sweep generator to drive the scope and MAKE it a spectrum analyzer.
All you needed was a ramp voltage to sweep the varactor tuning with.
Nowadays I could use a transceiver hooked up to a computer and use

digipan or ham radio deluxe to do that.

OK, to get an _accurate_ answer with respect to grid driving power,
you need to account for the effects of the electrons going from
cathode to plate as they pass by the grid.  At high enough frequency,
this becomes significant.  This is quite apart from losses in elements
external to the tube.  One reference about this is Terman's "Radio
Engineers' Handbook, section 4, paragraph 9.  But just consider that
it takes a certain amount of _energy_ to push those electrons around
and control them, even if they don't actually ever come in contact
with the grid.

Cheers,
Tom

I had a little one band kit radio that was varactor tuned in my hands
for a while and used the sweep voltage from a scope to to drive the
varactors. I was interesting but the scope didnt have enogh
persistence to show a good display. It really looked cool when you
used a marker generator with it in a dark room.

Yes, but it is still Hi Z, the resistive portion
is in series with the inductive reactance.

Pete

Jimmie,

That sounds like fun - I will have to try that with my BITX20A which
I modding to varactor tuning

Charlie.

Haha...

I have a similar story.   I was at our local medical GP's office for something and his cellphone started beeping CW. It spelled out the call letters and said the name of the company (I've never heard cellfones do that) and I said "Oh, it just said 'KJH123 Verizon Com'" or whatever it was.

He gave me the strangest look!

I said, 'I mean your cellfone, it just sent something in Morse code'.

He gave me the strange look again and says 'Uh, mmm-kay'.

-Bill

Hi All,

First of all, Happy New Year 2009 and wish you the Best on your radio activities and projects.

I like to inform you that our friend Martein, PA3AKE, has updated his web page on high performance analog front-end.
See the below sub-directories where you will find a lot of information and measurements on DDS.

http://www.xs4all.nl/~martein/pa3ake/hmode/index.html

Local Oscillator:

o Impact on Dynamic Range
o   Design Choices
=84X 1GHz Reference Clock
=84X AD9910 Prototype Board

=84X AD9910 and SSB-Noise
=84X AD9910 and PM-Noise

o Sideband Noise Measurement
=84X Reciprocal Mixing
=84X Crystal Notch Filter
=84X Quadrature Mixing

Best 73 and enjoy the visit

Gian
I7SWX

You could build a N2PK VNA which is pretty accurate.

Hey OM
I guess it's so ez to forget about the law. The law of conservation of
energy.
You can't create or destroy energy. Physics 101.

Hey OM
You'll have to find that sweet spot for the ramp sweep frequency,
depends on the bandwidth of the scope or the persistence of the crt.
The sweep bandwidth depends on the varactor tuning voltage, not on
the frequency. So you have to adjust the peak voltage of the ramp to
adjust the bandwidth. On the scope where X input is your ramp voltage
and Y input is the detected output of the tuner, with the sweep on the
scope turned off. The resolution will depend on the input bandwidth of
the tuner.

I would like to experiment with delivery of receiver audio over the Internet to multicast receivers (clients); currently I use SIP and RTP (conventional VoIP calls and UnRealMedia streams) which establish a single session per listener, which is not the best use of bandwidth and rapidly saturates a slow pipe with multiple listeners. Multicast delivery of audio avoids this problem but is not widely implemented on the public Internet. However, folks who happen to have a LAN connected to the 'Net through a *nix box can run a multicast routing process (example, 'mrouted') to encapsulate and tunnel multicast packets between LANs. The MBone virtual multicast network (and similar projects) used this approach.

Would anyone care to set up a multicast tunnel with me for experiments? I am running 'mrouted [version 3.8,prune,genid,mtrace]' and can provide binaries and source code for whatever flavor of *ix you can run on your edge router, or if you have Cisco IOS that supports DVMRP, that would work well too.

Once connected, either side can deliver video and audio to multiple hosts on the other side using no more bandwidth than is required for a single unicast session. The BBC for example offers higher quality radio streams

to users who access them over multicast as it conserves bandwidth and
reduces cost, but in the U.S. there is less interest at the moment.

My receiver happens to be homebrew, which makes this request at least
nominally on-topic ;)

TIA,

Michael

I've noticed a lot of the early designs from the late 20s
and early 30s used cathode bias (resistors to B- off the
directly heated filaments) on triode RF power
amplifiers. Were they adding a small amount of
bias to make them easier to drive? Or, for what reason?

One other thing, I don't remember seeing parasitic
suppressors on early rigs; did the need become
evident when TV became popular in the late

40s? I know those early TXs could take off in
the nether regions :)

Pete

Cathode bias resistors on rf power amps were a safety measure.
If the tube lost drive with no bias it could draw enough plate current
to MELT the plate, especially if run with a high voltage near (or OVER!)
the maximum ratings. Of course, using a C- supply would serve the
same purpose. Many rigs actually used batteries. Since the grid
current flowed in the reverse direction from the battery, a C battery
would actually be RECHARGED in normal use, so they tended to last a long
time.

Parasitic suppressors were not used in the early days since no one was
on the vhf frequencies there wasn't anybody to interfere with!

Actually, parasitic oscillation might show up in other ways making the
amplifier hard to load, and if detected this way the builder would take
steps to stabilize the circuit.

The reason I asked this that Bill (Exray) ran
 into some problems with his early TX project.
The old neon lamp trick showed
the presence of VHF parasitics, and adding suppressors
improved a few of the problems he was having.

We were discussing the use of cathode bias resistors, and
I couldn't quite grasp the reason for using them, but
tube protection makes sense.

Suhdanteet   [Jarmo Sepp�l�, 08.05.2008]

Volkswagen tuo s�hk�auton markkinoille jo 2010

Euroopan suurin autoyhti� ottaa kaupallisen s�hk�auton tuotantoon vuonna 2010. Auto on tyrkyll� suurkaupunkien ekoautoksi. �

Bioenergia   [Jarmo Sepp�l�, 07.05.2008]

Turpeen poltto ajoi puun energiak�yt�n laskuun

L�mp�- ja voimalaitokset k�yttiv�t vuonna 2007 energiantuotantoon kiinteit� puupolttoaineita 12 prosenttia v�hemm�n ja mets�haketta 13 prosenttia v�hemm�n kuin vuotta aiemmin. P��syy k�yt�n v�henemiseen oli Metlan mukaan p��st�oikeuksien hintojen voimakas lasku, mik� lis�si etenkin turpeen polttoa. �

Strategia   [Paula Launonen, 08.05.2008]

Kemira yhdenmukaistaa energiaostot
Suomalainen kemikaalij�tti tavoittelee yhten�ist� energiastrategiaa kaikilla mantereilla. Oma tuotanto vakauttaa asemaa ep�varmassa ymp�rist�ss�. �

*Mik� on vastuu lehdell� t�ll�isen MEGAGIKAdisinformaartiohuijauksensa julkaistessaan? Vai onko koko ankan ainoa tarkoitus katsoa kansan aktivisuutta reagoida sysimustaan valtiovalheeseen? Ett� SUPO/Sis�ministeri p��sisi selville maamme ydinvastustajien tasoista toimia ja noin.

****ALLERT sitten n�hd��n miten valtavisa harhoissa ydinalamme uraanikaivoksiaan maahamme on tekem�ss�, hei HALOOO!!! Jotain rajaa!!*****

Sotaj�lkien siivous   [Raili Leino, 08.05.2008]

Sieni sitoo uraanin vaarattomaksi

*Lienee muuten maailmankaikkeuden ensimm�inen ja viimeinen sieni joka tuhoaa ALKUAINEITA 4,5miljardin vuoden s�teilykestokuormineen! Vaan jos lienee sellainen "Atomipommin r�j�hdyssieni " koko sekouutinen T�?!

Maaper�ss� esiintyv�t sienet voivat muuttaa ymp�rist�lle haitallisen k�yhdytetyn uraanin harmittomaksi. �

Actually,Alot of ATX supplies have atleast a sense line on one of the
3.3V connections to the motherboard,IIRC it's usually brown,or
orange,and of a smaller gauge than the main wire.
I've seen some older Compaq server supplies that had sense lines on each
rail.

S.K.22.05.2008."P�lytt�jien t�yskato uhkaa vied� kes�n marjat. Omenapuut ja herukat kukkivat monin paikoin jo t�ysill�, mutta puutarhoissa on hiljaista. P�lytt�ji� ei ole liikkeell�. S��n l�mpeneminenk��n ei lupaa helpotusta, sill� luonnonvaraisten p�lytt�jien kannat ovat romahtaneet l�hes OLEMATTOMIIN! vaarassa ovat my�s mets�marjat, siel� esim. mustikan, puolukan ja vadelman p�lytys on l�hes yksinomaan kimalaisten varassa.

Mehil�istenhoidonneuvoja Ari Sepp�l� on kartoittanut p�lytt�jien tilannetta koko Suomessa. Uutiset ovat olleet yksinomaan HUONOJA! -arvioisin, ett� kimalaisia ja ampiaisia on nyt korkeintaan KYMMENESOSA normaalista tasosta. Tutulla omenanviljelij�ll� on tarhassaan tuhat kukivaa puuta. H�n ei ole n�hnyt t�n� kev��n� ensimm�ist�k��n kimalaista. Kimalaiset ja ampiaiset katosivat yll�tt�en Suomesta viime kes�m�. Syyt� katoon ei tiedet�. Sepp�l� ei usko tilanteen korjaantuvan edes seuraavana kes�n�!"

Niin TUSKIN tarvitsee jatkaa? Poriin on yl�tuuleen matkaa TVO:lle jo yli 50km. Ja kuten todettiin 90% katoaluetta aina kukkak�rp�si� my�ten on aivan hurjaa. (Huvittavinta, ett� kyseiselle kaverille l�hetin vain parisen viikoa sitten tiedot ydinaavikoitumisfaktasta, ja KAS oivalteli! Ei sanan sanaa siit�, ettei Suomella olisi mehil�isist� ongelmia. Kiitokset Ari n�in netin kautta, oikeesti! no toisaalta kaverin netit kuulema turpoavat kiukkuisen kent�n kommentteja aiemmasta virhetiedotuksista! Taisi ryhm�kuri olla mukana.))) .. Ydinvoimalan p��st�t tappaa siis todetusti jo kautta Suomen! Joten H�VETK�� muuta t��ll� aiemmin ved�telleet!

Vaikka t��ll� yritet��n pajunk�ytt�� ties mit� "varmaa" virus,punkki,bakteri,mit�lie tekaisua" toteenn�ytetyksi niin Sepp�l� kuittaa t�llaiset luulot jopa yll�tt�en ilmoittamalla, ettei syist� ole hajuja! Porissa vain muutamasta talvipes�st� on jokusia punkkeja l�ytynmyt ja mehil�iskato on edelleen mysteeri. Niin.. .? Tai oikeammin tarkoittaa sit�, ett� YKSIK��N julkisuuden tautipelleilyharhautus ei vakuuta ket��n! Eli j�� j�ljelle j�lleen keran VAIN ne joista kuiskitaan ovien takana. Ydinionisaation aiheuttama suunnistuseksymiselle j�lleen tutusti pojot! Sanoi ydinklingonit mit� lyst��! Outoa kapinointia kent�lt�, jopa musta, ettei jotain ole tekaistu syyksi klassisista huijauksista, vaikka ydinala on parisen vuotta puukottanut? Lieneek� vaan niin, ettei valheet mehil�iskasvattajiin en�� uoppoa, kun netiss� puhelevat tiet�v�mm�t syyksi ydinavikoitumisia, ja beetasoihtup��st�j�?)

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

Has anybody had any experience with those little cables used for connections on computer motherboards, typically to front panel LEDs, etc? The pins are 0.1" centered and would be extremely handy for routing +12v around while breadboarding stuff. I think the official name is IDT cables. However, whenever I search for them, I get the crimpers for the massive 40 or 80-conductor cables for ATA ribbons! I just want to make the little 2-3 conductor thingies...

Thanks for taking a look.

I have only seen these done on a machine.  There are probably jaws available
for crimpers but I would think it would be a total fumble since they are so
small.

If you only need a few, then get them out of junk gear.  You can get eye
strain trying to chase stuff like that down on-line or in catalogs and have
to pad for the minimum order .

"IDC" perhaps? "Insulation displacement connectors." The ones that
go on ribbon cable can usually be installed using a vice, or perhaps
even a pair of pliers for a small one. The ones I tend to use because
they are available to me have loose contacts that crimp one at a time
to wires that have been stripped, and then snap into bodies. I use
them exactly as you suggest, for running power supply connections to
little boards. Both DigiKey and Mouser catalogs have large connector
sections, and I'm sure you can find appropriate ones in there.

Cheers,
Tom

"IDC" perhaps? "Insulation displacement connectors." The ones that go on ribbon cable can usually be installed using a vice, or perhaps even a pair of pliers for a small one. The ones I tend to use because they are available to me have loose contacts that crimp one at a time to wires that have been stripped, and then snap into bodies. I use them exactly as you suggest, for running power supply connections to little boards. Both DigiKey and Mouser catalogs have large connector sections, and I'm sure you can find appropriate ones in there.

Cheers,
Tom

And, after pinching the "tabs" on both the bared wire as well as the insulation with a small pair of forceps for more years than I care to remember, and being shocked at the $350 price tag for the tool for them in Digi, I was directed to Jameco. They have

http://www.jameco.com/webapp/wcs/stores/servlet/ProductDisplay?
langId=-1&storeId=10001&catalogId=10001&productId=159266&

(If that URL gets screwed up, it's their part number 159266. It crimps nicely and curls the tabs around the conductor and pinches the ends into the wire)
At $12.95, (Made you know where, but appears to be sturdy even after considerable use), makes me want to cry that I hadn't found it earlier.

Ross -
  There are 0.1" dual-row headers that use 0.05" spacing ribbon cables, and the connectors crimp on. These are "IDC" or "Insulation Displacement Connectors". You can assemble these with a little vise quite reliably. You don't often see these below 10 conductors, and I don't think this is what you are asking about because you want the connectors for 2 or 3 or 4 wires. But you'd be surprised how quickly you need an extra conductor here and there and pretty soon end up at 10. And they are so cheap and so reliably assembled that even though you don't need 10 conductors, you might want to use them anyway. As long as you line up the polarizing stripe on the cable with the socket, these are very reliably and very quickly assembled using nothing more than a vise.

  There are also single-row headers as well as dual-row headers that use housings and discrete wires. These are "rectangular" connectors, and I think this is what you want. The board side is called a "header" and the wire side has a "housing" which holds the contacts. The contacts are crimped onto the wires and there are different contacts for different size wires. There are some specialized versions of these for terminating miniature coax. There are many manufacturers of housings and pins/sockets and crimpers and usually it's best to make sure that you are using all the matching stuff. Molex and AMP are the names to see in the catalogs. A "production" crimper can set you back many hundred dollars but a "prototype" crimper for $10-$20 is what you want. If you use a crimper that does not match the contact, the first time you tug on the wire the contact will stay in the housing and the wire will slide right out of the contact. So make sure you order matching crimper and housing and contacts.

  It's real boring to terminate more than just onesy-twosy wires using the handheld crimpers. That's why the "IDC" versions for ribbon cable are so popular. Even though you're not asking for the IDC/ribbon cable versions, if I were you I'd seriously consider using them even though you don't think you need so many contacts.

  There are also IDC versions of these single-row connectors for discrete wire termination. They only work reliably for very narrow wire ranges, and if you aren't working with exactly matching wires I'd advise that you stay away from them.

Harold-

That tool looks a lot like the Radio Shack Catalog Number 64-410,
"Crimping Tool With Wire Cutter For Installing Solderless Terminals".
The Radio Shack tool has five crimp wells instead of two or three on the
Jameco Tool, and crimps 14 through 28 AWG terminals.

I use the same low-cost tool that I use for crimping Molex KK
terminals. It's not the right tool, but it works OK if I'm careful.

Try Jameco. They have '.100" Non-Polarized Connector Housings and Crimp
Pins' (Page 62 in the November 2008) catalog. (Part No. 100766 for
the female terminal, to disambiguate things). This is the closest (or
the same stuff) that I've seen to that used for computer reset button
wiring and the like. The recommended crimper is cheap, too at $12.95.

Another possible is the Molex KK line, with .100" spacing.

And for premium stuff, Dupont Berg Mini-PV, but if you have
to ask, you can't afford it.

Also many outfits (Molex, Panduit) have single row .100" inch
IDC connectors that take individual wires. (Newark?)

Hi all

I have got very simple noise source for receiver measurements, but
noise power verification makes some trouble...
Old analyzer noise floor is around -125dbm without input and noise power
using 10kHz BW is -95dbm using display 'peak' setting and long video
filter at 30MHz...

Same setup with display 'inf' setting shows -105dbm for the noise.

Sorry I don't have a manual for the analyzer to find what the 'inf'
means... but which value would be acceptable ?
I would use the first one ?

Service manuals are hard to come by anymore but I'll bet this guy can
fix you right up!

http://www.qsl.net/ka2pyj/pro2011.htm

I have a pro 2096 I bought off ebay for $50.00 as a tech special
guaranteed to be DOA

I shiped it to rat shack and they returned it saying parts no longer
available now I'm at $84.00 and counting!

I found on fixya, a problem with the ribbon connections but the tech
said the 103 pin chip was shorted!!

I refuse to believe that as it was one of the first batch that could
be modified to no gap status!! ! Now what shall I do??

Kurukshetra =9209, the annual international techno-management festival of the College of Engineering, Guindy, Anna University, Chennai, India, is here with a myriad of events to test your skills and showcase your talents in front of some of the brightest brains of the country.

Do check out Fox Hunt - A transmitter finding event for the amateur radio enthusiast, this event is aimed at boosting the spirit of the age old radio techniques. One of the best kept secrets in Ham radio, Fox hunt is a fresh start to a new adventure.

This SCIENTIFIC GAME helps every enthusiast to gain knowledge about radio direction finding, attenuation techniques and associated concepts like direct signal and reflected signal detection, orientation etc.

Visit the official site www.kurukshetra.org.in for more details.

There are guys who will go to the limits to repair DOA gear.

Maybe some other guys here will encourage you with suggestions. My suggestion is, unless there are some very unique technical specifications that you really need, to cut your losses up to this point and buy something that you have a high probability expectation will work, out of the box, and has some warranty protection (which usually means they may just give you a new device instead of fixing the old one).

I know someone who is working on a dead ham transceiver, all solid state and major ricebox brand, who has already spent enormous numbers of hours with little progress and with the full knowledge that most of the chips and sub-assemblies are no longer available or supported by the company.

We have been in this "new" throw-away economy evern since chips started coming out where the technology understandably must progress in a manner that automatically makes obsolete the prior generation of technology for the purpose of causing ownership of capabilities to be more expensive than if the older technology were made repairable.

Throw aways:
Actually I saw that coming about 20 years ago with the works in a
drawer by magnovox.
I ordered a surface mount hearing kit from Ramsey!! Had to use a
toothpic and super glue the components into place before I could
solder them! Back then the flex monuted magnifier was saficient,
now ,it requires a jewlers loop to see them!!..
However GRE should have offered to fix mine as it was the GRE
400/500 .They never answered my email??
Oh well I'll catch someone who wants to tinker or find a junk one in a
pawn shop??

I have not tried it yet as I don't want others to know who's calling me,
  but on my Ericsson P1 I can choose personal ringtones so it would be
possible to connect a CW-call to someone in my phone-book.

Hey. Notice how everyone in that picture is wearing a tie? The guy on
the left is wearing a bow tie, I thnk? Proper dressing; these days we
are too sloppy; eh? Cheers.

I use crimp on female RS 232 connectors
If you cant find a crimp tool they solder on very easily

Well, there has been a lot of useful technical progress but I am a little bit bothered by this trend to _also_ (besides not being able to fix anything because it is 'throw away") the trend to make stuff so that it actually has to be fixed by bringing the unit in for some kind of aftermarket repair, adjustment, etc., and it costs some money in addition to the inconvienience.

Cell phone viruses, for example, are known and the stories say they are already out there (one will drain your battery on you), and, so as we get more web access via PDA-type devices, what do you do if your thing starts acting up? Go to a URL and download a "fix" and if the virus fixes it so you can 't do that, then you have to send in your whole thing with $100 or so to have _them_ fix it? This is about what it's going to start taking soon.

Mark, KB9RQZ you are funny, trying to fool folks into thinking that
you are me by using "dloyd" but still posting under your Hughes
account and using your sig line....LOL

You are one kooky kook.

Have fun...while I sit back and laugh.

DL

Hi

Got a pair of MRF648 and would like to build a 100W 70cm PA running at 13,8V.
I have been looking for constructions/id=E9eas on Google without luck.
Anybody able to help me?

If You got an article i can use, please mail it to me: bv(--at..) mailme.dk

MRF648 data:

DESCRIPTION:
The ASI MRF648 is Designed for
12.5 V UHF large signal amplifier
applications up to 512 MHz.

FEATURES:
. Internal Input Matching Network
. PG =3D 4.4 dB at 60 W/470 MHz
. OmnigoldT Metalization System

MAXIMUM RATINGS

IC	11 A
VCBO	36 V
VCEO	16 V
VEBO	4.0 V
PDISS	175 W @ TC =3D 25 =B0C
TJ	-65 =B0C to +200 =B0C
TSTG	-65 =B0C to +150 =B0C
?JC	1.0 =B0C/W

Hi Brian,

My Motorola data book says these are designed for class C (e.g. FM) amplifier service, not linear. I suppose you should expect to get a little less PEP power out of them in linear service, for good linearity.

The Moto data sheet has a test circuit; I could scan it, if it would be any use to you. The microstrip dimensions are for glass-teflon board, er=3D2.55, 1/16" (1.6mm) thick. Of course, the test circuit is for a single transistor, not a pair. It is solidly class C: the base and emitter are both at DC ground.

Cheers,
Tom

Hey OM:
The messages on my cell are sent in CW. I used it just for work. My
boss sent her phone number and it came to me in CW on my phone. My
phone was a refurb. so I don't know how they did it. I've searched for
that program but to no avail.

A bit of advice:

The Motorola data book suggests that these devices are designed for Class C service, and their design guide gives a circuit without DC bias. The Vbe max is only 4 Volts, which gives a useful hint!

Your DC bias circuit needs to /very/ accurately track temperature to prevent thermal runaway - the design of the bias circuit /will/ /not/ be trivial.

The gain of the circuit will be disappointing - you'll be lucky to get close to 10 dB - so the drive requirement will be surprisingly high.

If I was designing a UHF PA, I'd choose FETs these days!

Bob

Thanks but I tried him already , my email got bounced. That account no
longer exist.

Most of the frequency blocking is done iin the uP board. If this can
be bypassed using a PC interface you are in business.
Interfaces to replace the uP board have been built around a PIC but I
have almost zero experience with a PIC.

I worked on mainframe  computer systems for 27 years and had a BCD
clock with neon lamp display, the counters used 12AX7s. It ran on my
desk for years and one of the new guys had built one  using 74 seies
ICs. He just could not believe it the day he saw me changing tubes in
my clock.

I need to make some trimmer cap replacements to an IC-735 and then do a PL adjustment after replacing them. To do this properly (according to the service manual) I need an RF voltmeter capable of measuring the range of 40-400mV.

I have a DMM with an input impedance of 10M ohms. I was hoping to construct a simple RF probe to the DMM and thus measure RF volts. However, the way I understand it, most of the suggested RF probe schematics (eg - the one in the ARRL Handbook) would only work in the range of volts, rather than millvolts, due to the voltage drop on the detector diode.

I have found a solution in the RSGB "Test Equipment for the Radio Amateur" book, which unfortunately requires building 4 transistor array to amplify the signal. A bit more work than I want to get involved in unless necessary!

So my question is if anyone knows of a simpler solution for an RF probe that can measure RF millivolts without an amplifier array?

Any suggestions greatly appreciated.

Larry VE7EA

Well, the old Boonton RF millivolters are dirt cheap these days...

Do you have a good scope on hand? Something along the lines of more modern Tektronix? That would be the easiest way to

do it. You can make a cheap RF probe using a hot carrier diode
or germanium diode, but the reading accuracy would be
questionable, especially at very low RF voltage levels.

Are you looking for a peak while tuning, a relative indication?
Or, do you need to know the exact RF voltage level?

Pete

Things like the PRO 2011 are fun to repair. It was built before chip
componets.

Jimmie

It's a common misconception that detector diodes (or any other semiconductor diodes, for that matter) don't turn on at all below some magic voltage. That's a lie! The conduction current versus bias voltage is a smooth curve that passes through 0 current at 0 volts (assuming you don't have light falling on the junction ;-), but there's more conduction at +1 millivolt than there is a -1 millivolt. I've built single diode detectors that I've used to detect RF as low as about 100 MICROvolts. It's QUITE EASY to see the output for a 40 millivolt input even if you use a cheap 1N4148 silicon diode as a detector and a not very fancy DVM to read it out. Try it! The thing is, the output at low voltages will be a voltage that is linearly proportional to the _square_ of the input voltage. That transitions to being linear with input voltage as you get to RF voltages in the range of "one diode drop," or about half a volt for standard silicon diodes. That square thing means sensitivity drops rapidly as you get to low RF voltages: cut the RF in half and the DC output drops to 1/4 what it was.

If you can get an RF Schottky diode, or a germanium detector diode, you'll have greater sensitivity, but if your volt meter goes down to below a millivolt (e.g., a 3-1/2 digit DVM with a 200mV range), you should be able to easily see the response to 40mV of RF with just a 1N4148-based probe.

To be sure I'm not trying to blow smoke some bad place, I just tried this, with a 1N4148 as detector. Using a _very_ cheap DVM with 1 megohm input resistance, I got 0.1mV output with about 30mV RF input. With a better DVM with 10 megohm input resistance, 15mV of RF is easily detectable at 0.1mV output. This was at 50MHz, but holds down at lower frequencies too.

Cheers,
Tom

```

I'd like to listen in on NIST's 60kHz time broadcasts on WWVB "directly", but I like building things, and besides, I'm too chea... er, "thrifty" to go out and buy a VLF-specific receiver.

Down in the basement (a.k.a. The Gorge of Eternal Electronic Peril) I have a couple of AM/FM clock-radios I've accumulated (yard sale? local thrift shop? I forget). Unlike today's Walkman-alike radios, these tend to have large, discrete, and easy-to-reach components, so I wondered if it would be possible to modify one of these to tune in RF in the WWVB and LF-RFID (125kHz) neighborhoods.

Before pulling anything apaprt I thought I'd check the math see if it was even reasonable. I assume these units are standard superhet designs with a local oscillator and a 455kHz IF section, such as the circuit at:

  http://ourworld.compuserve.com.homepages/Bill_Bowden/radio.htm

```
  AM BCB:             540-1600 kHz
  Tuning capacitor:   140-  15 pF (RF)
```

60- 10 pF (LO)
0- 12 pF (trimmers)

From Ye Olde Traditional Formula:

F = 1/(2 * %pi * sqrt(L * C))

it follows that, for a fixed L, F varies with 1/sqrt(C). The capacitance of the RF gang of the tuning capacitor has a 10:1 range, so it can control a frequency range of 1:sqrt(10), or 1:3.2. Similarly, the LO section provides a frequency range of 1:sqrt(6), or 1:2.4.

Working this backwards, it looks like an antenna loop designed for this capacitor would be between 620uH and 660uH; choosing 640uH and working forward the RF section would tune from 532 to 1624 kHz.

This means the LO will run from (532+455) or 987kHz to (1624+455) or 2079kHz kHz, a range of 2.1. Calculating from the low end the associated inductor (LO tank coil) would need to be 428uH yielding an LO range of 993-2433kHz; working from the high end we get 586uH, an LO range of 849-2079kHz. Even if I choose a "middle" value of 500uH, my LO calculations imply that the LO will be as much as 200kHz "off" from the ideal mixing frequency of (RF+455kHz) at either end of the dial; since radios appear (in general) to work, I'll have to assume there's a problem with my LO math.

But ignoring that for now (famous last words <grin!>), that says that if I stick a 75000uH choke in series with the radio's ferrite loopstick, giving a total inductance of 75640uH, the _RF_ section will (theoretically) have a tuning range of 49-149kHz. _IF_ I can get a LO that tunes in sync with this, that is, 504-604kHz, then the IF section will accept and amplify any AM signal from 49 to 149kHz, envelope-detect it, and feed the result through the receiver's amplifier.

I can see a couple of problems, even if I figure out why my LO math doesn't work out:

1) My desired LO range is 1:1.2, well below what the LO section of the tuning capacitor is designed for (1:2.4). However, it looks like slapping a 100pF disk cap in parallel with the LO section will reduce its range to around 1:1.2, and I'd need to find (or wind) a new tank coil anyway.

2) By putting a (relatively huge) RF choke in series with the loopstick antenna, I'm creating a fairly unbalanced "tapped inductor". I have no idea what problems might result from this.

3) I'll be limited to broadcast-alike (10kHz AM) or similar signals unless I want to add a BFO. Since curiosity is what's prompting me, I can live with this restriction.

4) Something Completely Different that I haven't even considered. <grin!>

Has anyone tried this? I looked around the 'web a bit, and did find some "upconverter kits" which appear to turn a superhet receiver into a super-superhet receiver <grin!>, but no one attempting to directly modify an AM receiver.

I have a couple of other items with higher priority (e.g. my "Federal and State 2008 Final Tax Exam") I have to get out of the way before I'll have time to solder anything, but I would like to hear from anyone who caes to comment (especially on my math <grin!>).

Thanks...

Hey Jimmie! My Panasonic inverter microwave croaked. I got
a chance to replace the power supply! The transformer looks
just like a fancy TV flyback, and the entire board weighs
about 8 ounces. The supplies are about 50 bucks new. Panasonic
vented the ovens through the top, and the moist air flows around
the electronics on the side, causing many early failure modes.
Figured you'd be interested.

Pete

May be a moot point if you're just doing this for the heckuvit but
there's nothing to listen to per se at WWVB since the time is encoded
with pulse width modulation, ie no voice.

Thanks Pete, I order one a couple of months ago to play with and found another at the thrift store the other day. I havent had much of a chance lately. I worked on main frame computer systems for over 20 years and now they put in a new system that is all PCs. You just replace the box when it breaks. I have been going to school on that so much lately I havent gotten back to my project. I do think that there is a place for HVSPs in amateur radio, maybe not microwave oven inverters but someone is going to come up with a good pwer supply at a reasonable price. I invision a device that would mount in place of an existing transformer and maybe sell for half the price of the replacement transformer. Lately my thoughts have gone more towards ways of modifying UPSs. The UPSs operate in a PWM switch mode to convert high frequency chopped signal to 60hz. I figure if you could modify the PWM data that is being used you could drive a step up transformer for HV. One problem I have is finding data on how these operate. It seems no one publishes a schematic.

I'm hoping that what I build will at least give me some idea of the WWVB signal strength. I started out being curious about the various "Atomic clocks" and thought about building a dedicated 60kHz WWVB receiver, but one of the problems one runs into with an idea like that is that "debugging" can be exremely frustrating without some piece of equipment that can offer a "second opinion".

It's a question of "navigating" towards a solution. Without some sort of compass -- or at least some recognizable waypoints -- you have no idea if you're getting closer to a working design, going in circles, or moving further and further away. VOMs, 'scopes, signal generators, spectrum analyzers, PRINT/printf(), and even (Ack! Phlbbbbt!) 16" tall fanfold core dumps are all tools we have created for helping us find our way through mazes where our everyday senses are useless.

And, as you say, I'm just curious: if WWVB is out there, unheard (by me, so far), I wonder what else might be? <grin!>

For $14 you can buy a decent converter- and put it on a decent receiver.
http://jacksonharbor.home.att.net/lfconv.htm

WWVB may be strong, but you may never know with your idea, - not knowing
your converted receiver's sensitivity, immunity to overload, images and the
ability to have a decent antenna.

It is something I looked in to one time. I hsd s few power supplies
and thought I would try it. I checked the outputs into a 10 amp loaded
and decided they werent a close enough match to even try. With no
voltage adjust on the power supplies I confess I gave up pretty
easily. If the outputs could be matched I would think this would work.
I would always try to use equalizing resistors. I have  had bad
expeiences when I didnt.

Since you've asked a general question, I'll give a general answer.
The problem with paralleling power supplies is that the voltage regulators will fight each other if they are not set to regulate at the same voltage. Using a low value resistor to isolate the outputs will work, but it will use power you may not want to waste and your voltage regulation will not be as good. A technique that was used on mainframe power supplies was to put low value resistors (actually, calibrated current shunts) on both outputs into a common load. Then the regulator on one power supply would be adjusted so that the voltage drop across its resistor would match the voltage drop across the other resistor. Once the regulators were balanced in this fashion, the resistors were removed from the circuit and the power supplies were connected directly to the load. As long as the power supply regulators tracked identically, there was no problem.

Another method that is currently popular among high-end supplies is to
have a current command output and a current slave input. With proper
jumpering, you set up one power supply as a "master" that outputs a
current command, and have a bunch of "helper" supplies that _don't_
attempt to regulate voltage, but just supply current on command.

If you're _buying_ supplies to do this, I'd suggest hitting the surplus
places for general-purpose switching supplies. MPJA has a good
selection, and I recall being able to find the manufacturer's data
sheets with some digging. You can get much nicer prospects that way
than trying to hack a PC power supply, although it's not as cheap as
dumpster diving for PC parts.

To Hijack an old thread...

The way tubes were numbered sometimes....
The 25L6 and 50L6 are NOT 6L6's with different heater voltages.
Actually both of these tubes are IDENTICAL with the 6W6GT except for the
heater ratings.

Ken, isn't the 6W6 a high perveance tube, hence the relatively high filament current? If so, it might work well in a TX with slightly lower plate volages. I have a sleeve or two of those looking for a project...

Pete

This is correct, but I found out that Tokyo Hy-Power HL-120U uses
these transistors in this PA. If they are able to make a 100W linear
amp i hope to be able to do the same:-)
 (The list where I figured out what transistor type is udes in PA's:
http://www.electronicpool.de/en/funkgeraetetypen.html)

I have not been able to find a schematic for HL-120U. It would be nice
to see how they designed the bias circuit.

You will find that the Mirage linears used the same family of
transistors as well.

48 volts is not that hard to do in an auto if you can mount a second
alternator. There is plenty of info on this on the web.

Kari-

I was hoping your question would elicit comments from others who are experienced in noise measurement.

Back in the 60s I had a job as a test technician. One assignment was to measure noise power in an AM aircraft receiver. I didn't know anything about noise, but had a procedure to follow.

As I recall, you set up the receiver with audio output that would drive an AC voltmeter calibrated in dB. You were to inject a modulated signal at the frequency where the receiver was tuned, and increase the signal level until the audio output increased by 3 dB above the noise level. The theory was that that signal power would be equal to the noise power in the channel.

I still don't know much about noise measurement. I can see how this test might be valid for an SSB or CW receiver, but doubt it was any more than a go/no go test for the AM receiver.

In your case, wouldn't RMS noise measurement be required rather than peak measurement?

A few years ago 42 V (3x14 V) was supposed to be the new automobile
voltage, but I have not heard much of it lately :-).

Hey OM,

I don't thin so. The hint should be the input impedence is like less
than 1 ohm. And although you may state that Vbe max is 4, that may
apply in class C but not say class AB where the all yoiu will be doing
is varying the current thru the base and the voltage will swing next
to nothing, like a base swing current of 10 or more amps into the base
```

impendence.

So you can't find a good schematic for a linear, I suggest you get a good spice program, and a really big smith chart.

I wouldn't use teflon board of any kind, when teflon burns it turns to mustard gas.

I read about the engineering and design that was going into the "new
48V automotive systems" in the IEEE Spectrum in the last year or so.

A brief Google search of ieee.org did not locate the article for me.

Hello Fred

Ok, average value was a good point, power is usually measured in RMS. I
believe it applies also to
wideband noise. Analyzer has also some own input noise, but noise
source signal was quite much
almost 20dB above it so there is some gap.
I guess taking off the 'peak' display will give readings good enough.

br Kari B

A lot of stereos have a DC-DC converter to generate a supply voltage like
that for the audio amplifier.

If you do build a DC-DC converter, then at least the output voltage could be well regulated and free of spikes, unlike an automotive "12V" supply. Of course quite a bit of shielding and LC filtering of the supply may be needed to stop the PA supply from having ripple that will cause AM sidebands on the Tx signal at an offset equal to the switcher frequency.

Chris

anybody have any airdux (or similar) coil stock they wish to part with (cheap)?
Looking for something #16 wire, about 2" diameter, maybe 3" long. Needs to be about 10 turns per inch.
Actually, if is is 2" diameter and 10 TPI, I need a 2" chunk for the 13-ish uH needed.
It's for a 6146 homebrew transmitter final amp.
tnx,
Bob

Lithium Ions are odd.

For the others, It is best to stay with same model cells. They are not created equal. It is pretty easy to just make the pack and do your testing with the MAHA, then throw out the cells that fall down first. I have the Radio Shack/MAHA and sometimes it doesn't detect properly until the pack gets going.

I have a handful of surplus NiMh 1ah AA cells that I constantly rotate and they get used in cameras, radios, flashlights and anything else. They were tab type that I pulled the tabs off and soldered a blob of Silver solder on the plus to make them fit in holders. Been using them for at least 5 years now.

Hey OM

One of the instructions for an FM transmitter using the AD chip is:
wait for interrupt and loop forever, this thing will be rocking at 1
giga samples per second.

Think I could put one of these chips in my yl?
```

Have you ever thought about winding your own? Find something of the right
diameter - PVC pipe, wood dowel, cardboard roll, etc. Wrap it with waxed
paper, then wind the wire on it tightly holding the ends down with tape.

Mix up some epoxy (24-hour cure will be stronger and more flexible, but 5-minute epoxy will also work). Apply the mixed epoxy to your coil in lines about 1/4 inch wide. Use at least six lines to make a sturdy coil. Let the epoxy cure for several hours to overnight depending on the epoxy chosen. Carefully withdraw the form and unroll the waxed paper from the inside of the coil. It's really simple to do and you have a real homebrew rig.

Make sure you use bare copper or tinned copper wire if you have to tap the coil. If you use bare copper, do not use polyester resin instead of the epoxy as it will not cure properly. I won't say why, but instead leave this as a mystery for the readers of this newsgroup.

Thats my plan.  I cannot afford the real air/mini-dux. :(

http://www.sparkbench.com/homebrew/grebe/rear.jpg

Forget the epoxy and use Duco Cement.

"polyester resin instead of the epoxy as it will not cure properly.  I
won't say why, but instead leave this as a mystery for the readers of
this newsgroup."
```

For me the Duco Cement has always held better than epoxy.

-Bill

I'm not sure if you thought of this, but there are a few guys who do nothing but part out Heathkits and sell the parts on eBay. Right now there's a DX-40 PA coil going for a few bucks. I've seen tons of AirDux styles (such as the DX-40), and also fiberglas and ceramic tanks from later Heathkits. I picked up a PA tank (ceramic form) for a TX project I'm planning. Often the PA tank switch is included, along with the standoff insulators. Worth a shot if nothing pans out here.

Hey OM

I don't know about that, I bought an airdux coil off of ebay came
with the catalog spec sheet for airdux coils
The guy listed it as a 100 watt rated coil turned out to be a 1000
watt coil verified by the spec sheet that came with it  Although I'll
say this nobody else bid on it. And sometimes they use other ebayers
pictures and tell you yup what you see is what you get. And the
picture isn't a picture of the item.

Personally I would roll my own. The trick that not to many people know
about epoxy is: heat it up first in a microwave oven, so hot that you
can't touch it. Then mix it.
I roll up a newspaper, in my case junk mail advertizing  flyers, for
the coil form, you can get any diameter you want this way.

Good luck and 73 OM
de n8zu

pictures and tell you yup what you see is what you get. And the
picture isn't a picture of the item.
Good luck and 73 OM
de n8zu

You misread what I said. My advice was to look for a PA
tank that was salvaged from a DX-40, DX-60, HW-101, etc.
Not NOS AirDux stock. Unfortunately there seems to be a
lot of folks chopping these old rigs up for parts and selling
them off piece meal. The early DX series used AirDux
like coils, and they are already tapped for the five original

HF bands. There isn't a big market for them so they
sell cheap.

Pete

This thread prompted me to look at B&W's Web site.

The price of the real Airdux is breathtaking.

A single piece of the 1610TL (10" long, 2" diameter, 10tpi, 16 gauge
wire) that the OP is looking for is $100.

Even the lesser-rated 3027 Miniductor is a hefty $40.

Even inflation doesn't account for those prices!
In 1967 I bought some mini-inductor stock for building a receiver
project from PE magazine. The #3016 mini-inductor was $1.03 and the
#3013 was $0.63 each. Today, they are listed on the website at $60 and

$20 each! Over a 50X increase in price! Inflation over some 40 years wasn't THAT bad (or gas would be over $15/gal today).

Note that the web site implies that they are no longer making the coils anymore, and that a 'special order' might be involved.

suggestions.

1) Fiberglass perf board is drilled on .1 centers so you can cut a piece down the middle of the holes, a bit of hacksaw work if needed, and use it as a comb spacer glued from the outside.

2) just cut several .2 inch strips of perf board with a row of holes in the middle, start at one end and feed a preformed slinky of the wire so that the strips space and support it.

2 is less work than 1, but it's real hard to get it nice looking.

3) Another way is to wind with a second wire used as an interleave, hot glue both wires and then pull out the second wire, (insulated which doesn't take the glue as well as the bare wire and stranded for flexability), from the inside after removed from the forming dowel. For transmitters, you'd probably need to treat the hot glue as a temporary scaffold and use a better glue for the final structure.

Getting set up to fabricate these coils may be a good garage business
for someone. I made some one time utilizing a metal dowel that already
had four groves spaced a 90 degress. I wrapped the wire around the
dowel and filled the grove with resin. This worked fairly decent. Im
sure that someone who already had some metal working tools could
fabricate similar setup or probably come up with something better to
set up an "as required" production line.

==
Nicad and NimH cells not regularly used can be best continously tickle
charged at 10 -40 mA depending on size/capacity.
Example : I have a Wahl cordless battery powered soldering iron 2.4 V (2
cells) which is continously trickle charged at 10 mA . When in use the
charge rate is switched to 300 mA.

Hey OM

I think yoiu mis read what I wrote. I'm just slamming ebay, not what
you should or shouldn't be looking for.
Towit if you see a pix of a coil pulled from a rig and the description
says its from that rig, doesn't mean it's the truth the whole truth
and nothing but the truth.You'd be better off using craigslist.com.
When using ebay it's like dropping a bar of soap in the shower in
jail.

Yeah, pete. What were you thinking? Real homebrewers don't use
ebay...craigslist is better.

I have one of those too. The originals were NiCad ? mAH, Then the 1.2 AH fast charge cells, but this last replacement bunch are NiMh 3 AH cells that I pulled out of a new Radio Shack race car battery. This has never gone dead on me even after sitting a month in the tool box.   I have both the original charger and the Orange one that is just enough for a decent charge but has no idea when to shut off. NiMh don't mind being topped off, but don't like to be hit really hard like NiCads do.

I'm looking for a dead HP848_ (e.g., 8482A) power sensor head that someone just hasn't gotten around to throwing out yet. I'm just looking for the connector to the cable to the power meter box, actually. Anyone??

Cheers,
Tom

Hello folks,

I read with interest on this web page http://blog.marxy.org/ about an article in WIA's Amateur Radio featuring a 10m FM transceiver design using an AD9851 and an ATmega16. Does anyone have a copy of this article (and the source code) so I could have a look at it please?

73

John

Based on what I found on google for 'high perveance' I guess so.
This tube has a max plate voltage rating of 330v, and a max G2 rating of
165 volts. It was used as an AF output tube in low plate voltage
radios, and in TV sets as a vertical output tube.

The 6Y6 is a similar tube, with 50ma more heater current and the same
plate dissipation rating in a larger bulb. It can handle higher plate
current than the 6W6, and it's max plate voltage and G2 rating is 200v.

I know that 50c5's and 50l6's were used in transmitter projects, so the
6W6 will work in the same circuits. The 6Y6 might bear looking into as
well.

Is there a feedback sensing line for voltage regulation
in the computer supplies that is accessible?
One trick I've seen done is to diode OR
the supplies, with the sense lines on the common
supply bus, after the diodes. MACom did this
on the massive switchers we used in our old fiber
nodes at work.

I have various old tube manuals in print and on disk.

None of them seem to list the maximum ratings for the 01A.
Maximum plate voltage seems to be 135 volts and max plate current
seems to be 3-5 ma. No mention of plate dissipation, but I think
that the plate voltage/current limitations will be the factor
here. I think the type '171 ('71A) which was used as an output stage in
old radios would make a better tube for this purpose. It can handle
up to 180 volts and at least 20ma of plate current. Again no plate
dissipation rating given. Also consider the type 12A, which is
a 'heavier' 01A rated to 180 volts and maybe 10ma of plate current.

I'd vote for the diode method, moving the sense line to after the diodes
OR just adjusting the supplies for about .6V more than what you want to
compensate for the diode voltage drop.

I wonder if NAA is still on the air.  They were on 14 KHZ IIRC and at
least the were sending CW.  I remember an article in QST where someone
built a regenerative receiver to pick up their signal using old
honeycomb coils and a .001uf variable capacitor.  Someone else did the
same thing, but used an old tv flyback transformer (minus the ferrite
core) for the coil and a three gang TRF capacitor to tune it.

But how long is a 1/2 wave antenna at that frequency?

I suggest you consult http://tf.nist.gov/stations/wwvbcoverage.htm. This shows the predicted coverage of WWVB at two hour intervals. Quoting from NIST's text:

"The coverage maps shown below are computer-generated estimates of WWVB signal strength under typical conditions. They show estimated signal coverage at two-hour intervals over the course of a day with WWVB operating at 50 kW radiated power. The shaded areas indicate those areas where signal levels are 100 microvolts per meter or greater. Note that the coverage area contracts during daylight hours and expands during nighttime hours."

It appears that, except for Florida, the middle and northern East Coast, and selected portions of the Northwest, the continental United States coverage is pretty solid. With the cost of commercial WWVB clocks being as low as $10.00, I'd buy one just to see if it can synchronize where you live.

QST and Ham Radio magazines have published several low frequency converter designs that may be useful for study:

Apr 2002 QST, Frank Gentges and Steve Ratzlaff: AMRAD Low Frequency Upconverter (correction Oct 2002)
Jun 1977 QST, Doug DeMaw & Jay Rusgrove: A High-Performance Low-Frequency Converter
Nov 1976 Ham Radio, Guenter Ruehr:Tuned Very Low-Frequency Converter
Apr 1964 QST, G. Holmes Wilson: A Simple Low-Frequency Converter
and for the Boatanchor enthusiast
Sep 1940 QST, Raymond Woodward, A Low-Frequency Converter

Tom & Larry-

Perhaps it is understood but not mentioned. If a test point has a DC level, connecting a diode might disturb the circuit.

If an oscilloscope is not available, I would use a 0.001 MFD series capacitor from the circuit, to a 10K Ohm resistor shunted by a 1N4148 diode to ground. The junction of the capacitor and diode/resistor combination, becomes a new test point that can be read on the lower ranges of a DC multimeter.

Of course the reading is only relative, but is quite handy when you need to tune for maximum output. In some cases I've permanently wired these test points into the circuit. That way you don't change tuning by removing the circuit.

It would be easy to cobble a FET cathode follower to avoid
the loading issues, but that might be more than the OP wants
to get involved with.

Yes, I was thinking that I probably should have shared the circuit I used. With proper construction the load on the RF circuit is mainly the diode's capacitance. For the test circuit, I used a 100pF cap from the RF to be measured, to the diode's cathode. Diode's anode to ground. I put a 10k resistor from the junction of the cap and diode off to an 0.1uF cap to ground, and monitored the voltage across that 0.1uF cap with the volt meter. I'd have used an RF choke instead of the resistor if I were trying to optimize it for some specific range of frequencies, or just a high value resistor. But since my source was a nice low impedance, there wasn't any need to optimize that part of the circuit further.

Sensitivity for very low RF voltages is greatly enhanced by using a high impedance meter. I would NOT put a 10k resistor to ground there if I wanted sensitivity to low millivolt RF, since the diode average current at low RF voltages is very low indeed. You can see that from

my reported results with the 1N4148 detector, with a 1 megohm meter
load versus with a 10 megohm meter load. With the high impedances
involved, the 100pF cap allows response down to well below what would
normally be considered RF frequencies. In the circuit described
above, the low-side 3dB corner frequency will be about that of the
100pF cap and the 10k resistor.

Cheers,
Tom

Not being a computer geek, would be this be usable for playing around with
hardware/software to control a PLL and maybe a display for a homebrew RX?

Pete

There are no sense lines available externally on a PC power supply. You might
take a look at the article on modding PC power supplies at
http://www.pavouk.org/hw/en_atxps.html. It shows a typical schematic (albeit a
bit aged now). Look at it and you can see where you might bring the sense lines
out of a "master" unit and run them into the "slave" units. No guarantee that
it will work, but I'd rather try that approach before the diode or resistor
solutions.
Of course, your PSUs will be different from the schematic in the web page, but

```
it should be similar enough that you can figure it out.

A bit overkill for that.  DSP cpu's are good for signal processing such
as digital filtering of audio.  Look for a nice AVR or PIC development
board.

No. I don't have technical references as Ken does, but from practical experience (hope I'm not disclosing my age here), but the 01A is much better suited as a receiver RF stage, or a one tube "regenerative" set.......... or maybe an audio amp driving headphones.

If you're bound and determined to use these old bottles, a

better choice (I think) would be a 45 oscillator driving another
45 amplifier stage.

I've tried using 01A's in transmitter duty, but usually ended up
noticing a bright flash and then no more glow at all!....SOB

A 45 by itself as a one tube, crystal controlled transmitter isn't
too bad either. An FCC monitoring station somewhere in
Nebraska (If I recall correctly) objected to my 45's key clicks,
however. (And I was running an honest 3 watts on 40 in
Washington State.

If I had the money, I'd be using 10s, 801s or one of the
bottles that are so coveted by the audio guys these days..
I saw a few 01 xtal oscillators in early QSTs, but very
little information was given about them. Globe 45 tube
are extremely pricey too, unfortunately. I have a few
45 globes in the stash..

don't forget the scope is going to give you a very high reading,
since the display is peak-to-peak. You'll have to take the
reading from the waveform's 0 voltage cross-over
poiint to the peak of on one side of the full
waveform, and multiply by .707 to get the RMS value.

Duh!! Stupid me! I glossed right over the DSP part, I thought it
was an earlier Motorola processor evaluation board.

Pete

Another point about scopes and their probes: they commonly put quite
a bit of capacitance (several pF) at the point they're measuring. A
10:1 passive probe with a couple meters of cable will have several
tens of pF capacitance in the cable, and the capacitive part of the
divider at the probe body can't drop that by more than 10:1. I'm not
sure where the OP will be probing; it may be low enough frequency and
low enough impedance that it doesn't matter. But it's quite possible
for a decent diode-based RF probe to present lower capacitance than a
scope probe. Probing things without disturbing them can be very
tricky at times.

Cheers,
Tom

As long as they use the same IC it shouldnt be too difficult to
figure  it out even if the rest of the circuit is different.

Hey OM
With my credit union branch going bellie up they tossed out tons of
computers. I can imagine there is comp supplies aplenty out there now
I see the wires them selves acting as milli volt drops. I mean how
many ground wires are coming out 8? Just use one ground wire and they
act like resistors. Albeit you better load those puppies up so that
little 18 AWG ground wire will do it's balancing act. I remember
buying comp supplies at Dayton one year for 50 cent they only worked
good when I loaded the 5 volt up big tme. Probably rejects brand new
in the box.

Hey OM
How old is a really really old dude? Is that like Methuselah?
Although Ima really old fart. I think there would be to much gas in
that tube for you to use it for anything but a gas regulator tube. I
bet it would fire up at 150 VDC wit that nice blueish glow.

I wonder if anyone knows of a project or kit that uses a 'scope
timebase output as the basis of an HF spectrum analyser. My aim is
to make something that would be useful for filter work so I'm not
necessarily looking for very wide frequency sweep.

TIA,

Charlie.

Dale,

Thanks for the pointer. I apparently overlooked this one. Now all I have to do is find "a decent receiver". <grin!>

Actually, it's a good excuse to fire up the old Heathkit Mohican shortwave set (with SIX -- count 'em! SIX transistors!) my father and I built some years back as a brithday gift for my mother. I replaced the power supply electrolytics a few years ago so I could hear static and background hiss over the hum (yes, it was that bad <grin!>), but the insides could use a good dusting as well. Tighten up the dial cord. That sort of thing.

And $14 vs. several hours with a 'scope and a signal generator trying to tune my "hacked" RF and LO sections sounds like a good choice.

Thanks.

Frank

My own analyzer was a kit for a QST project sold by
A&A Engineering; the design centered around a CATV
module and had it's own timebase and IF strip/log detector
internally. The analyzer used the scope as a X-Y display.
For serious SSB and CW filter work the VCO is going to
be tricky, you'll need low phase noise, etc.; and a good
set of narrow IF filters that can be swept is another
can of worms. Most of the ham analyzers are better
suited for wider IF responses and wide sweep ranges.
I did a major rework of the IF and Log Amp using an
Analog Devices chip, but the analyzer still has
limitations.

I'd seriously look at some of the DSP receiver kits that
are now on the market--most offer spectrum display
on the computer screen, and adding a good, but
simple, sweep generator might be an easier approach.

Pete

Old, crotchity, and ill temptered!! Ha ha.. Definitely in the Old Fart catagory. QST did show some circuits using the 01s in xtal oscillators, so I know it was done.Whether it worked worth a darn, who knows! I suffer from too much gas, but I've never glowed like a Smurf.

Hi Charlie,
For very little money, you can buy the miniVNA:
http://www.miniradiosolutions.com/

That will far outplay anything you can build. Because it makes use of a PC, it will have features well beyond a simple SA + tracking generator. In addition, it's a vector device.

GL,
Dale W4OP

Their scalar network analyzer looks awesome too!
There's an amazing lack of "boatanchor" hardware
in these devices.

That is not unusual. Many of those supplies require loads
or they will crowbar.

Dale,

That is neat but it works out as over �200 here (around $300). I
will bear it in mind as it would be great for antenna work using a
laptop.

Thanks,

Charlie.

Pete,

That does sound interesting and pretty inexpensive. You have me
thinking now :)

Thanks,

Charlie.

The 01A was considered a 'hard vacuum' tube, the '00 was a 'vapor' tube, or soft vacuum tube. The only reason that the '00 was even made was because many 'old timers' (at the time that the '00 came out) remembered using the ORIGINAL DeForest Audio which was a soft vacuum tube. By carefully adjusting the plate and filament voltages a very sensitive operating point could be found. The tube was probably acting as a thyratron at this point, on the verge of super-conduction. The '00 could also operate this way, but since it's manufacture was more controlled than the original Audion the operating point was well known.

Even with it's 'hard vacuum' the 01 didn't have as good a 'getter' as later tubes and would arc over with more than 130 volts or so. It was used as a transmitter before the type 202 tube became widely available, but was a QRP thing, less than a watt input.

Will it have enough output to drive a 245?

For filter work, I think you probably want a "sweep generator", not a
"spectrum analyzer". Many of the elements are the same but a sweep
generator is a far less ambitious project that is probably what you
want for alignments and filter design.

Tim N3QE

I would think a good SA with a tracking generator would be cat's meow. I wonder how a flat noise source would work in lieu of the TG to plot filter responses on a SA?

I'm sure it will drive a neutralized 245 to provide some gain.
You might not get enough drive for full power output from the 245.
(even if the 245 was run in class A, which requires NO driving power
you would still see SOME power gain).

A flat noise generator does indeed work well as a wideband signal
source. However, to make sense of the trace, the spectrum analyser needs
a lot of lowpass filtering of the signal (after detection). This is
averages the spiky noise signal. Most modern digital analysers do have
an 'averaging' function but, on the older 'analogue' analysers,
filtering works fine. You would normally the maximum filtering possible
- typically 100 or 30Hz.

I doubt it very seriously. I suppose if perfection was achieved in matching
the 01's output to the 245's grid was possible (I, for one cannot do it),
the losses would be enough to tickle it into the beginning of class C.

Ken's idea of going to class A might work, but the 245 would be running
in a very inefficient mode. There is one website showing a couple of
45's running in AB2 (how do you make a sub 2?) . Another website
has some interesting stuff with 245 chatter...... (you may have already
seen it, but just in case..........

I can't fathom a 20s xmtr circuit running the PA in Class A.

That's a pretty good price, but if you're prepared to import it yourself, you can save some money. My HP and Avantek SAs cost over £35000 together!

Bob

Well, yeah, if you can swing it. But a sweep generator is more than
sufficient for filter design and alignments. And every decent radio/TV
repair shop had one already meaning they show up really really cheap
on E-bay or hamfests a lot. Or you can homebrew a sweep generator (see
EMRFD or a ARRL handbook) out of junk box parts for your particular
band of interest.

Actually AB1 would be better. My point was that you don't need driving
power until you start drawing grid current. As long as the final
doesn't draw grid current you are not loading down the oscillator tube.
The question was would the 01A be able to drive a '45. My answer is
yes, but probably not to full output....meaning you won't be able to
supply much grid current.

Yor're correct (as qualified, and as usual)
But the 01A is NOT a suitable (satisfactory?) driver
for a 45.

Happy New Year! (Will I see any of you on "Straight Key Night?(

Well the original question was would it work, and the answer is yes, but
not very well.

If you want to use tubes from the same era, then I'd pick a '27 for the
oscillator. The 27 is probably the first tube in a chain of evolution
that led up to the 1626 which was used for the same purpose in the ARC-5
transmitters. (though the 1625 is a heck of a lot easier to drive than
a '45!).

We can pay those prices for big-name industrial saw blades in Europe
too. However, a 10in/254mm blade with negative rake carbide teeth can
also be found for less than $30:
http://tinyurl.com/4lflw2

That's not so bad, and I'd guess that someone in the USA is selling them
too.

Your being a bit precious, surely - he is BUILDING something using
surplus bits.
Do you mine and smelt your own copper wire, then grow the cotton to
insulate it? - if not, well, are you a TRUE homebrewer?

Andrew VK3BFA.

Delving further I surfed across a twin blade circular saw.
Two counter rotating circular blades that leave no burrs in aluminum.
Makes lots of aluminum waste though.

If anyone over here is selling them near that price I can't find them.
I may splurge a bit and get an $80 one.
A big piece of aluminum stuck between my fingers convinced me.

Hey OM

did you looky at harbor freight tools?

I seen a twin blade circular saw $60 only

Commercially, we use a triple chip blade. The current blade is almost 10 years old and leaves a mirror finish on the aluminum cut.

> At last - someone using the right tool for the job

You can get fine-kerf angle-grinder blades, that's what I use.
They need frequent replacement, but for the occasional cut, it
beats a hacksaw.

I just realized I worked 37 hrs of overtime in the last 2 weeks. I
think I am going to treat myself to one of the triple chip blades.

Jimmie

Hey OM
If a twin blade 6.25 inch blade cuts like a 14 inch blade what's a
triple blade cut like?

And can you shave your face with that mirror?
That would make one heck of a disco ceiling mirror ball.

Twin blade is lifetime gaurantee.

Hey OM

Heck just across the pond in Germany they gits 4 month paid vacation
plenty of time to use a diamond fingernail file to cut that aluminum.

Hey OM
If a twin blade 6.25 inch blade cuts like a 14 inch blade what's a
triple blade cut like?

And can you shave your face with that mirror?
That would make one heck of a disco ceiling mirror ball.

Twin blade is lifetime gaurantee.

73 OM
n8zu

It is a single blade- and the triple chip refers to the rake of individual teeth. I think every aluminum house uses a triple chip blade. Not cheap at $150 or so- but as I said, one of our blades is around 10 years old, is used daily and still cuts with a mirror finish.

Dale W4OP

Hey OM
The nature of the beast is:
single ended amps produce rich even harmonics
Push Pull amps produce  rich odd harmonics
```

so you can gits odd harmonics from single ended but they are poor like
me.

I'm thinking of using the crystals from a few scrapped
Heath HR-10 receivers (cheap half lattice design) in
a cascaded half-lattice or in a full lattice filter for a
receiver project. I've found tons of info on half-lattice
design, but the full lattice info has been a problem--
anyone have any links to articles in the vintage QSTs?
I have the CDs..

Pete

Hola, Pedro,

I could scan sections about full lattice filters from Zverev and from Van Valkenburg into PDFs, if you're interested. For Van Valkenburg, it's a whole chapter. It would then be left as a "small exercise" to go from their math to what you want. I suspect a Spice simulation would be appropriate.

Cheers,
Tom

Hola, Pedro,

I could scan sections about full lattice filters from Zverev and from Van Valkenburg into PDFs, if you're interested. For Van Valkenburg, it's a whole chapter. It would then be left as a "small exercise" to go from their math to what you want. I suspect a Spice simulation would be appropriate.

Cheers,
Tom

Hi Tom, nothing that design heavy... I have to work with the parts I have, and was looking for some practical guidance on the subject. I'll have to dig into the old SSB Handbook and see if the QST references will uncover any leads.

The 5763 seems to be an original design as opposed to a re-design of an
octal tube into a miniature tube format. I can't find any similar beam
power tubes with a 6.3v .75 amp heater in larger format.
It is amazing just how many miniature tubes are simply re-hashes of a
similar tube in a larger format.

For example, the 6AQ5 is a rehash of the 6V6. The 6BQ5 and 6GK6 are
rehashes of the 6F6 (which itself is a rehash of the 42 and 2A5, and
similar to the directly heated '47). The 6AK6 is a rehash of the 6G6G.
The 6CL6 is a rehash of the 6AG7. I could name many more, and I haven't
even considered the Lockal equalivants either.

I've figured out to use QST View... Finally! And was able to
dig up quite a few articles from the 50s into the early 60s.
I have enough reading matter to come to some conclusions..

Pete

I have one(MC2833N) on a circuit board all wired and working as a 6M FM
transmitter as shown on a Motorola data sheet, would this be of benefit
for you?
Ned
I can be reached via email at autoivins at Q.com

Good afternoon you all, I just got an early Christmas president. My
```

friend dropped off a Radio Shack Pro 2011 scanner a couple of weeks ago for me to take a look at and now he says for me to just keep it. The problem seems to be in the liitle uP board. It will work a while and then just go crazy. I thought maybe it was a power supply problem but even running it from a battery doesnt help. Ive tried replacing caps on the uP board with no help. I had really given up on it but I would like to try one other thing now that its mine. IF I could bet a schematic on the thing I would like to see if I could control the radio from a PC port. I have done this before by bit banging data into the PLL circuit.

If you have a schematic you could email me I would be thankful.

You're right on both counts.  The 5763 is an original design (at
least, I've never seen anything like it in octal), and most of the
first generation miniature tubes were direct or near-direct copies of
existing octal designs.  Only later did the myriad tubes intended for
TV service appear, and to a much smaller degree, the hi-fi tubes.

73,
Mike, KK6GM

Can anyone suggest a source of a circuit or kit for a mono amp to
increase my laptop's headphone output level to line level?

As a starting point, it would be helpful just to learn what these
levels are. I want to drive a line-level transceiver input for digital
hamming.

Any suggestions would be appreciated.

Tnx & 73, Tom

Typically it needs DECREASED not increased. There are circuits on the internet for attenuating the output sound level from the computer to be acceptable to the radio for digital modes. One could potentially use the volume control on the computer but since the level is relatively high, it's hard to get the fine control without an attenuator between the computer and radio.

You have an impedance mis-match. Use a radioshack xformer with the 8ohm
side on the headphones jack and the 5k output to the line level. You will
need a pad or simply a pot after that.

I saw something with an 8 ohm resistor from the output of the
soundboard to ground and a 10k resistor from there to the input of a
tape recorder.

What I ended up with is an L-pad with 10K in series with the input and 100 across the output. This is supposed to be a 40dB pad. I may need something in the high 30s instead of 40, because to get a satisfactory waterfall, I need to max the mic gain in Windows 2K. Tomorrow I'll get a 5K pot and connect it in series with a 5K resistor in place of the current 10K resistor. 8-9K might be where I need to be to have the Windows level control somewhere in the middle of its range.

Thanks to all for the suggestions.

Tom

I've posted this on the XmLog group without a response explaining the meaning of this message: "Rig Response 3 , expected 38." Attempting to configure a so-called virtual com port from a freeware program so that I can run that log software on a discrete port, I get that message. What is 3? And if 38 is the optimal figure, how do I get to 38?

Is there nyone in this group who can explain this?

Thanks & 73,
Evan

Tom,

I'm not using a laptop, but my desktop has sufficient audio output to drive line-in levels on the rear of Icom transceivers. If your laptop does not produce high enough levels (see other responses about impedance matching), it might be cheaper and "cleaner" to buy a little USB audio sound card (Turtle Beach has one for $30, about the size of a thumb drive) and grab

audio output from that.

An impedance mismatch in this case only equates to a possible power loss.
The transformer (I think RS only offers a 600:600 ohm line transformer)
is good because it offers some isolation between the equipment.

Is your laptop audio stereo or mono? You'll have to take that into
consideration,
since you don't want to short on of the channels using a mono plug.
If stereo, you will need to work up some sort of passive mixer
(resistors would do it) to combine the two channels.

Pete

It would help if you listed critical details like:

1. what is the name of the application.
2. its version number.
3. whether the documentation specifies what kind of operating system it needs, what kind of hardware is a pre-requisit. And, whether there is a "readme" file with description of issues.
4. what OS you actually are using.
5. whether you attempted to contact the source of the software for an answer.
6. whether the com port is specifiable from the software.
7. does the com port hardware actually exist and correspond to what is configurable from the software.
8. and out of curiosity, what is supposed to go in or out of the com port in this "logging" software? And, what is it supposed to connect with?
9. did you buy the software or get it from someone else who has it working? (ask them for help?).

That is for starters.

Hey I found the problem. The little board isnt a uP board after all. I thought the big glob of epoxy on it was encapsulating a uP. Apparently its just a keyboard matrix with the decoding done on the main board. I found some really bad cold soder joints that connected the keypad to the main board. When I pulled the wires loose they had no solder on them at all. Called my friend and told him to come get it and he still said it was mine. I would still like a schematic or sevice manual for it. Does anyone know how old it is. Also I think GRE made the radio and also sold the radio under their name. Does anyone know which model that was.

Jimmie

Line Level for consumer audio is -10dBV or 0.316V RMS or just below a
volt peak-to-peak. Solid state audio equipment typically has an input
impedance in the kohm range.

Usually a headphone jack has more than enough output. Some sound cards
or laptops are "energy smart" and turn off the output if they don't
see a low-impedance load plugged in. Other times they have their own
volume controls that can be overridden by Windows and sound card
settings. Other times common-mode noise can dominate (drowning out the
signal) giving a very real advantage to using an isolation
transformer. There are many many articles on the web about using
isolation transformers to hook your computer to your radio.

Most of the 'HiFi' tubes were better build versions of existing tubes.
The improvements reduced hum by shielding G1 better from the heater, and
also reduced microphonics by simply building the tubes more rigid and
rugged ("like a brick s@#T house").  They were probably tested better
too, with the ones not making the grade re-branded with the part number
of the original lower grade type.

I'm a little confused again.

Setting up a 1624 tube for cathode biasing and also need to create a center tap for keying to ground.

The book says 610 ohms at my voltage. So would I use a pair of 1200 ohm resistors in this case?

My logic is since there is not a separate cathode then the two R in parallel would raise the filament 'cathode' 600 ohms above B-minus.

TIA and Merry Christmas,

Bill

(Disclaimer -- I haven't done this. It's just knowledge gotten from lots of books, and lots of solid-state circuit design experience).

No, because all the filament voltage will go to mildly heating up the resistors, and none will go to wildly heating up the filament.

Use a center-tapped filament transformer, and put the 600 ohm resistor between its center tap and ground. If necessary, use a separate transformer just for the 1624s.

If the tube filament is running on AC then a resistor from the
transformer winding center tap to ground would do the job. If the
filament winding isn't center tapped, then two resistors form the center
tap. Usually two low ohm resistors (say 22 ohms) are used with a third
resistor to ground for the cathode bias from the junction of the two
resistors.
You could just use two larger resistors as you suggest, but in the case
of an audio amplifier how would you bypass it with a capacitor? (use TWO
capacitors).

If the tube filament is running on AC then the problem is compounded
since you might not be able to isolate the filament supply from ground.
Guess battery operated radios used C batteries.

If his un-centertapped filament winding is ONLY supplying that one tube
and he has each leg going to ground through a 1200 ohm resistor that
would result in a 600 ohm connection to ground.  So it should work.
Remember that's 2400 ohms across the filament, it won't suck up much
heater current at all.

A capacitor is an electrical/electronic device that can store energy in the electric field between a pair of conductors (called "plates"). The process of storing energy in the capacitor is known as "charging", and involves electric charges of equal magnitude, but opposite polarity, building up on each plate.

http://electronicstopics.blogspot.com/2008/10/capacitor.html

Correct, both resistors would essentially be in parallel, and from
the hot cathode to ground. Using two resistors would help
balance out the 60 cycle hum as an added benefit, which is
what I assume you're trying to accomplish.

Pete

hey OM:

Exactly and you will need at least 10 watts of resistors to be safe. Because they also will have to handle plate, grid1, grid2, and the current they draw across the filament. I suppose if they where wire wound like 25 watt you could stick a ferrite rod in their hole and make them your filament chokes also. But if you use carbon comp resistors then part of your drive will go heating those resistors, so not much gain going on there.

hey OM:

Well you have to be desperate to ask what does it have to do with
homebrew?
When you should have asked: what does it have to do with amateur radio
homebrew?

But this ham needs is support. Not condescending attitudes. His first
problem is he gots Windoz.
The second trouble is that's like freeware. You gits no support.

A whois lookup of xmlog.com I finds this information:

Administrative Contact:
McAmis, Mike   m.mcamis@VALLEY.NET
Blat
433 Hanover Center Road

Etna, NH 03750
US
603-643-4361 fax: 603-643-4217

Now that FAX number is sum church. So whether you can gits ahold of Mike at the phone number listed as his registrar contact, you might end up on a wild goose chase.
Maybe you should try emailing mike.

It's obvious what that means, the freeware is looking for a 38 and your rig is telling the freeware 3. Your'e set up for the wrong rig. You have to go into the settings and find what rig is listed as 3 and set the sittings for that rig.

Towit it's like you set it up for say a 706MkII when you should have set it up for a 706MkIIG.

Now if you can't figure it out then you are going to have to try them all twice. The second times always the charm.

good luck on straight key night.

Well they ain't filament chokes, but in the drive circuit the drive
signal won't go to heating them up if they are chokes. So they will
only be taking about 1 mil of current from the filament circuit.

One possible problem.  If this is an RF amplifier circuit you probably
want to use NON-INDUCTIVE resistors in the circuit or they WILL act as
chokes!

Dear List,
I am looking for your wisdom and lore regarding uses for some of the more exotic capacitors found in my junque-box. I have been a ham for a whole sunspot cycle now. I know what an NP0/C0G capacitor is and when to use it, I know electrolytics, tantalum, and about the use of Temperature Compensating capacitors. I have checked the usual places (books, ARRL TIS, the archives of this list, etc) and none of these resources tell me several important things: what they look like and where would I use them in ham homebrew circuits. Here is my list:

UNKNOWN TYPE AND APPLICATION:
1. Blue, really shiny, flat, and small like a disc ceramic.

2. Orange and shiny- definitely not electrolytic or tantalum. Both bulgy and flattish.

3. Green and shiny- both bulgy and flattish. (I've heard these are either mylar or polyester film. How do I tell them apart?)

4. Dark orange (maybe brownish?) and bulgy.

5. Yellow rectangular blocks.

KNOWN TYPE, UNKNOWN APPLICATION
6. Labeled "monolithic dip"- what do I use these for?

7. "Mallory DC Film" (250V)- what do I use these for?

8. What's the difference between the following three types of mica
capacitors?
* Dipped silver mica
* Old-style micas (colored dots and physically large rectangular
blocks)
* Modern, not dipped-silver micas

Thank you VERY much for any input on this matter.

73,
Ross, NS7F

Howdy,

Without seeing the parts I can only take a WAG at what the
capacitors in question might be. This web site might help.
http://www.faradnet.com/

> UNKNOWN TYPE AND APPLICATION:
> 1. Blue, really shiny, flat, and small like a disc ceramic.

Possibly Murata (or others) ceramic capacitors designed for
use in AC line filters.

> 2. Orange and shiny- definitely not electrolytic or tantalum. Both
> bulgy and flattish.

Possibly Sprage Orange drop polypropylene film capacitors. There are
various types in this product family. Generally good for high dV/dT
or pulse current applications like snubbers. Could be metallized film

or film and foil.

> 3. Green and shiny- both bulgy and flattish. (I've heard these are
> either mylar or polyester film. How do I tell them apart?)

I think this is a good guess. Mylar is a polyester film.

> 4. Dark orange (maybe brownish?) and bulgy.

Another film capacitor. If brown possibly Panasonic polyester.

> 5. Yellow rectangular blocks.

It's a film capacitor, Possibly Wima. I can't remember what the material is. Could be Philips polyester too.

> KNOWN TYPE, UNKNOWN APPLICATION
> 6. Labeled "monolithic dip"- what do I use these for?

General low energy use, coupling, by pass and filtering.

> 7. "Mallory DC Film" (250V)- what do I use these for?

Polypropylene, bypass or noise suppression.

> 8. What's the difference between the following three types of mica
> capacitors?

> * Dipped silver mica
> * Old-style micas (colored dots and physically large rectangular
> blocks)
> * Modern, not dipped-silver micas

Dipped mica is still made and good for RF coupling and snubbers. I use these in antenna tuners.

The box type with dots are similar construction but with metal plates instead of metalization. They're good for RF coupling and high current like tank circuits.

The non-dipped I'm guessing Unelco metal clad which are more like the box style without the box. Less series inductance so better high frequency performance. I've used these in solid state linears up into the VHF range.

The film capacitors vary in the material, polyester (mylar) polyproylene, polycarbonate, polystyrene and more exotic films like polysulphone...each has its strong and weak points. Some use mixed dielectrics. The construction can be metalized film, metal foil, double layer (self healing) or stacked film. The method for attachment of the lead wires may vary too with high current capacitors having thicker termination or schouping (sp?)

metal sprayed onto the ends of the foil or film. The Farad Net site
documents some of the types and applications.

As always YMMV. I'm just guessing.

73,
Grumpy

I'll add my cents worth.
A few years ago I bought some high-voltage disc ceramics like you are
describing. 6kv rating in 'rf' values like "681" (680pf). About 10mm

in diameter and 5cm thick. The 1kv ones are about half that size.

I used them in the output pi-network loading of a Galaxy 5 and they were
up to the task although they are plain Z5U types.

They are marked, btw, no mystery as to their rating. You don't normally
look at something this small and think 6kv!

Probably is a disc ceramic :-). Some makers use blue on their higher-voltage disk ceramics. Labeling will probably tell voltage and capacitance.

> 2. Orange and shiny- definitely not electrolytic or tantalum. Both bulgy and flattish.

All of the above are probably film capacitors of some kind or another. Color doesn't mean much except maybe to an audiofile.

> KNOWN TYPE, UNKNOWN APPLICATION
> 6. Labeled "monolithic dip"- what do I use these for?

Widely used ceramic capacitors. Small values are good for RF, larger for bypass. Depending on the dielectric may not be worthwhile for audio.

> 7. "Mallory DC Film" (250V)- what do I use these for?

These are higher voltage film polypropylene capacitors.
>
> 8. What's the difference between the following three types of mica capacitors?

> * Modern, not dipped-silver micas

All are potentially useful where you need a low-dissipation capacitor. The old-style micas less so. Sometimes even if it's a rectangular package with colored dots, they are just ceramic and not micas.

For many modern purposes, modern C0G ceramics will be superior (better lower tempco) to the long-recommended silver micas.

>
>Alligator effect. Wide mouth receiving everything.

"Alligator effect" normally refers to higher transmit power (not higher
antenna gain) -- big mouth, small ears.

>If you don't need to
>pickup everything then why bother? It just makes it harder for your WiFi
>router to cut through all the noise of distant stations it doesn't
>communicate with. ...

It actually usually makes sense, since higher gain means narrower
receive pattern, which better rejects off-axis interference.
Interference in exactly the same path is possible but unlikely.

=======================================

They might be OK capacity and voltage wise ,but are possibly not
suitable to handle RF current ,so when using them in HV RF circuits it
might be better to use a few in parallel.

That may well be true but thats also why I stated a case of a 200-watt
output rig where they DID work.

Hey OM

well I tell you what let's say a certain company is running
racketeering like some big electronics firm.
This racket involves taking peoples money and laundering it then
giving it back after it's been laundered. Now lets say you partnered
with this company then you too would be guilty of racketeering which
under RICO laws is a felony.

So in the end your so called definition of partner would fall under
the guise of RICO and you will go to jail for a real long time and
your best friend in jail will be bubba.

In other words your guilty by association.

73 OM

Capacitance should be more stable with temperature change.

> * Old-style micas (colored dots and physically large rectangular blocks)

Cheaper than silver mica.

> * Modern, not dipped-silver micas

Should be larger (?) and more for higher currents (RF) and maybe voltages.

Micas should be very resistant to the kind of ageing in paper dielectric caps (leakage, change in value, short, open). And, also, some capacitors, such as electrolytics have capacitance changes as a function of voltage applied, and thus are very non-linear.

> Thank you VERY much for any input on this matter.

If this is important to you, then it would have been more helpful to us if you gave some specific dimensions of an example or two, and described any writing or other markings (such as bands, "+", "="), and voltage and capacitance numbers or even code numbers. Many new caps don't have specific characteristics on them any more, just code numbers and you have to guess or know what they mean.

Another possiblity would be to obtain catalogs, even current catalogs, from parts suppliers. Often they have pictures or line drawings that can give you hints.

I don't know about the newest ARRL handbooks, but many of the old ones have typical pictures of examples and you can go by that.

Be aware that some of the newer caps do not have forms or colors that are as standardized as they once were and the external appearance might not give you a good clue as to what you have.

Capacitor color codes (six dots) on the old caps are also "decoded" in some of the older handbooks.

Hey OM

I hate to inform you but not one of those is an exotic capacitor. They

are all garden variety.
Now maybe a Russian made 1 farad 28WVDC capacitor the size of an overnight bag that would be exotic.
Since yoiu been a ham for a sunspot cycle maybe you can find sum sun spots in that junque box for me eh? I could use sum sun spots.

73 OM

For an everyday driver  I do find putting together a computer using
Linux a bit of a hassle. However for a special purpose computer like a
server I prefer Linux systems. I guess Windows has become the WD40 of
operating systems, its useful for a lot of things but for most special
purposes yo ucan find something better.

After years of avoiding morse code I am finally getting into it. the
ideal of operating a very simple transmitter appeals to my junkbox/
trashcan construction mentality.
I am looking for a substitue for a 6L6 that has the plate brought out
the top. I was trying to build a little Glowbug transmitter but was
having all kinds of problems neutralizing the the thing. I think I
would have better luck if I can separate the grid and plate circuits
from each other. I am considering an 807 as a replacement Suggestions
would be appreciated.

An 807 IS a 6L6 with a top cap anode connection. Any of the TV line
output valves will also do the job if you want cheap, the 6DQ6B works
well and has an octal base (The sockets for the 807 are rare).
6146 or 2e26 etc work well but will cost you more.

The 807 uses a readily available 5 contact socket. The 1625 (12V
equivalent) uses a 7 contact socket which can be difficult to locate.

I'd go for a PL509 sweep output tube. I've had a kilowatt out of four of them!

I'm in the UK and haven't been able to find any at the local hamfests,
where can I get them from?  Octal sockets are readily available over here.

My first amp had 3 PL519s with a lethal power supply using a voltage
tripper direct off the 240V mains, heaters were direct off mains via a
1n5406 diode. It's still up in the parents loft somewhere, must dig it
out over the holidays and give it a try....

Howdy,

When you get bored of big jugs with nipples on the top, you
might try a 6T9 compactron. It's very nice for a small transmitter.
You get a high mu triode and beam power pentode in one package.
I think the pentode is good for 12W.

I'd probably use a 1625 since they're cheap from Fair Radio
and sockets... we don't need no stinking sockets!

73,
Grumpy

Hmm, I'm surprised you haven't come across any at boot sales. I'm of
no help when it comes to vendors in the UK. You might try your
favorite search engine. The first page of this search links to several
vendors including one in AU.
http://www.google.com/search?hl=en&q=5-pin+tube+socket&aq=f&oq=
eBay is another possibility.

Maybe you should look at how you bypassed the screen grid to ground with a capacitor. Once I built a 6146 pentode, grounded-cathode amplifier for 160 meters and was disappointed that it went into self-oscillation. After thinking about it, and then the light bulb over my head went off, I looked and realized I did not have the screen grid bypassed to ground (what, 0.01 mfd or so?), and when I soldered one in, all of my self oscilation stopped. You should not have to worry about neutralization if you are anywhere in the HF bands (or, at the worst, maybe on ten meters).

I've built several 6AQ5, 6V6, etc., one tube, xtal-controlled
CW transmitters. All worked fine.

I am considering an 807 as a replacement Suggestions
> would be appreciated.

You might also want to check the connections to the control grid. If for some reason you have a -- for example -- cold solder joint and the control grid is actually floating, then it will oscillate all by itself, too.

Might try Fair Radio Sales, in Lima Ohio (USA). I think www.fairradio.com,
and they do (most of the time) answer email. They have stuff that is not
in the catalog, too.

Do you realize that the RMS value of half-wave rectified AC is not one half
of the applied RMS voltage but rather 0.707 of the applied RMS voltage. So
your three 40 volt filament PL519s actually saw about 56 volts RMS across
each filament. I'll bet you wondered why the filaments were so bright.

To properly measure this voltage, you need a true RMS voltmeter. Most
inepensive AC voltmeters actually measure the peak voltage and display the
result on a scale calibrated for a sine wave input. RMS (root mean square)
is the equivalent DC voltage that would produce the same HEATING in a
resistance as the applied waveform.

Most hams are quite confused by this. Looking over some websites
explaining this, one of the better ones is a Google Book Search of
"Electric Machinery Fundamentals" by Stephen J. Chapman who presents the
mathematics in detail starting on page 163:
http://books.google.com/books?

id=ltg6QWnn2_4C&pg=PA163&lpg=PA163&dq=RMS+value+of+half+wave+rectified+AC&source=web&ots=MAd5Qt1_Qr&sig=qj4RhhaoT6OgA34lCcYxK2cy18k&hl=en&sa=X&oi=book_result&resnum=10&ct=result

As an interesting side note, the Philips datasheet on the PL519 is the
first I have seen that explicitly discusses Barkhausen interference and how
to suppress it.

Howdy,

Coincidence! That book is on my kitchen table at the moment.
It's ok, but this is probably more suited to the purpose;

Chinese Ceramic 5- and 7-pin sockets for 807's and 1625's are readily
available. e.g. P-ST5-216 and P-ST7-311 from Antique Electronic
Supply, or the same thing from ESRC on Ebay, items 130273824548 and
130273500741, or similar thigns from at least a dozen other web

suppliers. (Antique Electronic Supply and ESRC I've been doing
business with for many years). Vintage ceramic sockets from the 40's
and 50's made by EF Johnson etc. turn up at hamfests pretty regularly
too.

Dunno if it's been mentioned yet -- 2E26. The 807 is _not_ a 6L6 in a different envelope -- it's quit arguably the 6L6's big brother, but it's got different ratings; it could probably be shoe-horned into a circuit designed for the 6L6, but you'd be missing out on about 6dB of final output power.

Antique Electronics Supply has 2E26's for $6.00 each, so it's not a bad buy -- and the 2E26 goes into an octal socket.

Have you considered a 6L6 with careful shielding at the socket? IIRC the pins that neighbor the plate pin would be at RF potential; you could put a big, flat, high-value ceramic right between those socket pins to shield the grid, and possible even extend the shield out if you were willing to hand-make a cap from copper strip and Kapton tape.

It's kinda heroic measures to take on a tube that's more expensive now than it's "high-tech" RF brethren, but if you just gotta have that metal-tube look it may do the trick.

I have a NOS 6DQ6 I can use in place of the 6L6s. I think they will
work. the biggest problem will be relocating the plate circuit. I will
have to add a front panel to my "fool killer" to hold the tuning
caps.

Jimmie

I could do with a pair, I have several 807 in the junk box and the look
far better to me than the "Modern" style of valve.  The email address is
valid BTW.

Thats happened, when you raid a cathouse you get the piano player too.
Perhaps one could prove their disassociation enough to stay out of
jail but your lawyer may be putting a new addition on his house and
dedicating it to you.

Even modern Chinese-made 807's have the ST glass shape.

The one that is not sexy is the 807W.

My favorite book of tube pr0n is "RCA Air-Cooled Transmitting Tubes",
TT3. Great big full-page engravings of the best tubes. Worth all 25
cents.

Tim.

Hello zu,

You're right about the guilt by association, just look at what happened to
OJ Simpsons' friend today. 15 years is along way to go for a ride along.

73
Steve.

Dear all,
I am just taking my first small steps into homebrew and learning as much as I can, but I have run into a problem that has me stumped. I'm seeing some odd behavior with a variable air capacitor (first time I have played with one of these), and have not been able to hunt down anything relevant searching the net, so I am hoping someone out there might be able to help me understand this. It is a 6 gang model with sections of 120,150,20,30,90,and 30 pf. I was able to use a continuity meter to work out the lugs, and found that the rotor is continuous with the frame, and stator is isolated into 6 seperate sections with no continuity between the rotor and stator. I assumed that I could jump the stator lugs (none of which are continuous with the rotor) with some copper wire to add up the gangs, but when I do this the continuity meter tells me that the rotor and stator are connected. It only happens to the gangs that I jump. I was expecting continuity between the stator segments of the jumped gangs, but not between the stator and rotor. Can anyone let me know if this is an

expected result, and if not suggest what I might be doing wrong?
Thanks in advance for your help.
Rusty.

Rusty,
  That is an odd result...Are you certain that you don't have a stray wire
touching the frame somewhere?
If you measure an open from two gangs to the frame, and then jumper those
two gangs, measure a short, and then cut (not desolder) the wire connecting
them, are both stators still open with respect to the frame?
Are there trimmer capacitors connected from each gang to the frame (screws
with a thin mica insulator between the plates)? If so, perhaps you are
damaging them when you solder wires to the stator lugs. (Assuming you are
soldering).
Let us know how this comes out. Homebrewing is great.

Bob WB0POQ

Bob,
I think I just sent you an email by mistake when I was trying to post a reply (sorry about that). In case anyone else is interested, it turns out that the suggestion to cut the wire instead of desoldering led me to find that just heating the lug could recreate the short. Apparently there is some solder on the inside of the capacitor that caused the short after it melted when I was adding the jumper wire. Desoldering the wire must have coincidentally reversed this. I was able to heat and tap to get rid of the short and all seems to be working now.
Thanks for the help,
Rusty.

The 6BG6G / GA sweep tube is identical to the 6L6G but with a top plate cap.

The 807 IS a 6L6G with a 5 pin base and the plate connected to the top.
The published ratings of the 6L6G look different than the 807 because of
their intended use. ICAS ratings for the 6L6G were never published.
Also the 807 has additional shielding and insulation over the 6L6G that
make it usable at higher frequencies and voltages than the 6L6G. Most
807's have ceramic spaces to support the plate which are lacking in the
6L6G. But make no mistake about it, the two tubes share the IDENTICAL
cathode, grids, and plate structures.

The 6BG6G tv sweep tube IS an 807 with an octal base. It has the same
ceramic plate supports, but lacks the extra rf shielding.

The 1625 is an 807 with a 12.6 volt heater and a large (same as type
'59) 7 pin base.

The type 1614 is a metal tube based on the 6L6. It is a transmitting
version, and probably has additional shielding. Otherwise its internal
structure is the same as the 6L6 metal type.

The type 1619 is sorta kinda a 6L6 with a directly heated 2.5v cathode. Same metal bulb as the 6L6. Specs' are different due to the different element spacing thanks to the filament cathode. This tube is often triode connected to replace 45's and 2A3's in old radios with a socket adapter.

As a result the of the construction differences regarding shielding, the 807 often would NOT need neutralization while 6L6G's and 6BG6G tubes used as rf power amps do.

The 6L6GA was identical to the 6L6G except that the bulb shrunk from an ST16 to an ST14 size. The 6L6GB was identical except for the bulb changing again to a T14. The 6L6GC is a totally different bottle with higher plate and screen dissipation and plate voltage ratings. The 6L6GC was said to be a plug in replacement for the older 6L6 tubes, but RCA kept the 6L6GB around for a while anyway. In fact a bias re-adjustment was a good idea when replacing an older 6L6 with the 'GC version if a cathode bias resistor wasn't used.

> Antique Electronics Supply has 2E26's for $6.00 each, so it's not a bad
> buy -- and the 2E26 goes into an octal socket.

Building a small 2.4 GHz detector:

<http://www.atvinderby.co.uk/2.4Ghz_SWR_Meter.htm>

Regarding the dimensions of the wire loops:

ant: 28 mm square
reflector: 30 mm square
separation: 10mm
wire: 14ga solid (1.6mm dia)

Are these dimensions center-to-center of the conductors? Or are these dimensions the space between the conductors? With a conductor diam of 1.6mm, this is more than 10 percent of one dimension (separation), so I think it's important to get it right.

Also, is the reflector to be grounded or floating?

Thanks.

JIMMIE <jimmie68@gmail.com> wrote:

> I am considering an 807 as a replacement

Jimmie-

Just how simple will this transmitter be? My first novice transmitter was built from an ARRL publication back in the 50s. The specification was for a single 6V6, used as a crystal oscillator with output coupled to the antenna.

I found I could get more power with a 6L6 plugged into the same socket. Along the way to getting more power, I found that crystal current would increase to the point where the crystal would fracture!

If you use a 807 or 1625, I hope you will have a lower power oscillator driving it. Something like a 6AG7 would make a nice crystal oscillator, and should have sufficient output to drive an 807.

73,
Fred

It's probably not actually all that important. Quads are not highly in their dimensioning. Altering the positioning between the driven (active) element, and the reflector, will change the antenna's pattern (gain and front-to-back radio) slightly, and will alter the feedpoint impedance slightly. Neither of these changes is going to be particularly significant (and quite possibly not easy to detect) in this situation. The fact that there's a lot of additional metal in the neighborhood of the antenna (the BNC connector, etc.) is probably going to alter the pattern more than the spacing different will (compared to a theoretically perfect quad in free space).

The pattern of a two-element quad is fairly broad, and the front-to-back ratio isn't terribly high. It's not the best design for pinpoint aiming / location of a microwave source... but that isn't really what this device was intended for. As a field-strength meter, it'll work fine (and probably just about equally well) with a 10mm separation edge-to-edge or center-to-center.

>Also, is the reflector to be grounded or floating?

In a quad, it is usual for all of the elements other than the driven one to be floating. Since the article says that the reflector is fastened with a dollop of glue, I think it's safe to assume that it's intended to be floating.

That detector is a slick little design - thanks for posting the link!

The 6AG7 - 807 combo is a classic. E. F. Johnson sold a 50 Watt Novice transmitter in the '50's with this tube line up (also a 5R4GY rectifier IIRC). Other tubes that have been used as the oscillator/driver were the 6CL6, 12BY7, 6GK6, and 5763.

A year or so ago I toasted a cap in my SDG tuner. I don't recall the value
but it was one of a few in that tuner with ratings between 7.5 and 15 kV.
They looked just like you described. I order a replacement, plus
replacements for all the other HV caps in that tuner just in case. The
parts from Digikey looked just like the parts in the tuner, blue, shaped
kind of like an overweight disc ceramic.

Only a 100 watt rig, but if you hit the feedline with enough SWR you sure
can get the volts right up there.

..

No way!

Back in the old days I've used both 6L6 and 807's and they are not the same
tube at all.

You could probably use a 6L6 to drive an 807 though

IIRC, the usual driver for an 807 was often a 6AG7  but I'd sure a 6L6 would
be fine

Just for grins I got out the RCA tube handbook and compared the plate curves for the 807 and the 6L6. Up to the limits for the 6L6, they are IDENTICAL. The 807 curves go to higher plate voltage and current.

The 807 and the 6L6 have the SAME cathode, grid and plate structures. The differences are in the shielding added to the 807 to reduce grid-plate and grid-cathode capacitance, and in the plate support spacers which are ceramic in the 807 to increase the operating voltage rating of the tube (which is also helped by the plate top connection). You can see the added shielding just above and below the plate supports. The 807 is a MUCH better performer at RF than the 6L6, it usually does NOT require neutralization and would have more power gain than the 6L6.

At Audio frequencies the two tubes will perform IDENTICALLY within their maximum ratings.

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

- - -

Thanks for your comments and evaluation of the project. They are helpful to someone not skilled in the black art of wireless :-)

I plan to modify the design a bit, eliminating all coax connectors & adapters, using just 2 banana plugs (and supporting plastic block) as the connection to the meter.

Is it any more efficient to use copper foil or PCB material as the reflector rather than wire?

Thanks.

A novel bit of kit, looking at the photos it appears to be being used with a DVM, depending on how you want to use it you may find an analogue meter easier. It will show changes better than a DVM. How about buying a movement and a box and building a totally dedicated unit? I'm tempted to make something similar.

An interesting design...

Keep in mind that you are building a relative, not absolute measurement device. ie you can calibrate (or not) it anyway you like. Any piece of wire will have a voltage induced into it by a passing EM field!

The only real concern is that you may want to ensure that the directivity of the quad is reasonably unidirectional. Some quad designs have pretty bad front to back performance. This may give you erronous results if you start seeing reflections or other TX's of the back of your antenna. The easy way to overcome this is to calibrate the pattern by rotating the unit in an active 2.4GHz field and noting some values. You can then use these in later tests.

Cheers Bob

Wow...thanks for the info. They are considerably closer in specs than I
realized.

Of course, you could run an 807 quite a bit past their official ratings and
never burn one out.

I recall tuning my transmitter for absolute maximum output...and that
occurred right around 50watts input.

(probably on 40 meters. I'm sure that on ten meters it would have been a lot
less)

Ran my 807 rig for years like that.

Don't really know what my 6L6 transmitter would have done...
just ran it on 40 meters at about 25 watts input...we always just considered
them to be audio tubes.

If I were going to build a tube transmitter today, I'd probably use a 6146B.

That should certainly work!

>Is it any more efficient to use copper foil or PCB material as the reflector
>rather than wire?

I believe not.

PCB material will probably be less efficient - standard FR-4 fiberglass-and-epoxy has significant losses at 2.4 GHz. Also, the presence of the FR-4 will change the effective length/diameter of the reflector loop... you might have to change the loop diameter to compensate.

Foil would probably be bit less efficient than wire, assuming that the width of the foil was the same as the diameter of the wire - less surface area for the current to flow through, and perhaps more current crowding to the edges of the foil due to skin effect. It'd also be significantly less rugged.

Once again, neither of these losses of efficiency is likely to be terribly important in this application, but why run the risk?

I'd just stick with solid copper wire of a reasonable diameter/gauge, as it'll be electrically efficient and mechanically strong and rigid, easy to get, and inexpensive.

Well the 6L6 has changed over the years, while the 807 never did (except for the 'W' version). Later 6L6 versions might have changed the outward appearance of the plate in response to cost cutting and automated assembly lines, but the internal spacing of the elements remained the same. If you look on the QST archives (are you an ARRL member?) on line for those old 'QSL 40' series of articles on home brew transmitters using the 6L6G tube you can see in the pictures how the plate structure is the same for the original 6L6G tube as the 807. And if the claims for this tube in those home brew articles is true, the 6L6 was JUST as rugged as the 807 in being pushed past it's ratings. Only the 6L6 would probably arc over at the socket before the plate voltage reached what the 807 would handle (I've heard of 807's taking over 1000 volts on the plate just fine!).

The official ICAS ratings for the 807 allow up to 750 volts at 100ma plate current, and there is a typical operation shown at 75 watts input, so at 50w your transmitter wasn't even breaking a sweat yet! A pair of 807's in AB2 (SSB linear) will put out 120w PEP, just about the same as a pair of 6146's. The 6146B officially will do about 135-140w in the same service.

Note that ICAS ratings for the 6L6 were never published, but you can assume that the 6L6 is identical to the 807 EXCEPT for the plate voltage rating, which I would guess is good to 500v or so.

Been a long time...but I am sure the plate voltage on my 807 was at least 600 volts or so.

One thing I also recall, when I had a filter cap short out on a different set...
is seeing the rectifier tube arc over.

Of course, once the faulty cap. was replaced...the tube worked fine!

I would think so, at 2.4Ghz there is, no doubt, "only skin effect." Although, I doubt you would notice a great change in efficiency, it should be prove-able, at least on paper. The biquad uses a solid reflector plate for good reason, wire is cheaper/easier to obtain. If the foil side faces the element, I should doubt any rf gets past it to the fiberglass-epoxy to be "lost" in efficiency.

My statement above applies here ... all the wire element can "see" is reflector, with foil.

Tear apart some LNA/satellite feeds to the dish, you will not see them using wire reflectors there; I think there is good reason.

Just my opinions drawn from my readings/study, looking at commercial equipment and hands-on ...

One thing I do totally agree with, it WILL work well with just a wire reflector.

Regards,
JS

<snip>

FWIW, here is a homebrew quad 837/807 linear that does 2kw PEP with 2KV on the
plates (I have it but did not homebrew this one):

http://www.cybertheque.org/homebrew/837_linear

I took the photos some years ago using a digital camera with focus and image
burn issues; this summer I intend to reshoot these with a better camera.

Michael

Looks good!

For "on-line" viewing the photos you took look fine on this end.

Halfway down this page (it's a PDF doc):

<http://www.cablesandconnectors.com/PIX/CC-040.pdf>

the TNC and BNC connectors are advertised as "dual-crimp". What does this mean? "Dual" as in center in crimp and outer shield ferrule crimp?

As opposed to what? Single-crimp? That would be connectors that use the center, solid conductor as the center pin and then crimp the shield ferrule? Or...?

Newly (did you guess?) into small coax connectors and trying to get the terminology straight...

Thanks.

Good for you: A good find and good practice for looking for the
obvious and non-technical answer to a problem. Very interesting six
section capacitor!

The common BNC "crimp" connectors have you solder the center pin to the center conductor of the cable, then assemble the outer with a crimp.

It works quite well in my experience, but I have yet to do this without distorting the center insulator and having to trim it with an X-acto knife to get it to fit, and I'm sure that in a critical application (like TNC in the GHz) that I'd be creating an unpredictable impedance bump with my hacking. This is bad enough with cables that have solid dielectric; I can only imagine the pain it would be with foam. In a production environment I'd almost certainly want to spring for the necessary crimp tool to crimp the inner, if the quality were there.

(This is opposed to BNC connectors where you thread in a plug to capture the outer conductor between the outer shell and a rubber insert. It also works well, but it is bulky and the connectors cost more. And you're still asked to solder the center pin on, with all of the accompanying center insulator distortion issues).

The author says he tried that and it didn't work as well:
"I tried connecting the antenna directly to a micro amp moving
coil meter, however there was very little meter deflection from
a Wireless LAN card."

Impedance too low, perhaps?

Clifford Heath.

I built a 837 "linear" back around 1958. I used mercury vapor
rectifier tubes - love that blue glow. It worked pretty well at about
1200V. I used it mostly for CW and some AM. The 837s were cheap and
pretty rugged. Damn near killed my self on the high voltage so I got
rid of it.

That would be the Johnson Viking Adventurer. I built one in 1955 from
a kit. I later replaced the 807 with a 6146 - didn't make much
difference, actually.

I believe I tried lengths of a 3% to 5% shorter length with the director, than the drive element (i.e., the one in front of the reflector), settling on a 4% shorter length ... anyway, that is common in HF parasitic arrays ... this is equiv. to a 3-element quad on HF.

I just dug it out and measured it, this is what it appears to be,
alright. With a spacing between driven element and director of ~0.2
wavelength, center-to-center.

Regards,
JS

Tim, I solder these on the N connectors all the time with no problems.
I have an old Weller soldering gun with the tip removed. I wedge the
pin between the two electodes on the gun, slide the pin over the
tinned center conductor and pull the trigger for a couple of seconds.
The pin cools almost instantly preventing deformation of the
insulation. Ive been doing this for over 20 years using the same gun.
This may take a little practice not to melt the insulation. I
remember  that it wasnt to bad getting the hang of it.

Jimmie

Yep, that's what I started out with. Bought my Adventurer used back in 1964
along with an HQ-110c.
When I got my General ticket I got a nice drifty Knight Kit VFO.

My antenna relay was taken from an old pinball machine!

My best contact was Ascension Island . Africa on a 40 meter CW..

I used a
wire vertical...
that was not terribly vertical <G>

Thanks Tim, I rplaced the 6L6 with a 6DQ6 and all is right with the
world on this end. Im putting out about 40 watts on 80M.
```

My next project may be building a little super rengerative receiver.
Im trying to see just how little I can get by with and still have a
productive station.

Jimmie

Had company today, been in and out all day ... sorry I didn't offer more.

A wavelength at 2.4Ghz will be approx. 12cm, half-wave ~6cm, 1/4 wave
~3cm. (with a very thin wire 1/2 wave monopole-omni-element I find
~12.25cm works for me, element dia. will affect this, as other factors ...)

Anyway, I looked though my old emails for something a friend sent me,
thought if you were interested in the 2.4g fsm, you might be interested
in this, if nothing else, just because the dude is so complete!:

http://www.users.bigpond.com/darren.fulton/yagi/13_element_yagi_antenna_for_2.htm

You will notice, he uses a plate reflector ...

Regards,
JS

So about 26.8mm square?

> With a spacing between driven element and director of ~0.2
> wavelength, center-to-center.

So the director should be 25 mm forward (toward the uwave source) of the driven element? (3e8 / 2.4e9) x 0.2 = ~25mm

Do these numbers look right?

Thanks.

I also noticed that he cut his elements to a precision of 0.1mm.  That
would be correct if the boom were an insulator or the elements were
inserted in insulating sleeves.  However, since the 10mm square boom
is metal and effectively "shorts" part of each element, the actual
element length includes part of the diameter of the boom, thus adding
approximately 5mm to each element length (not including the reflector
and driven element).  A VSWR sweep test would have shown the problem.

My elements are made from #14 bare copper wire. It is difficult to measure each side, individually, when constructing the antenna. Better to cut the wire to 1 wavelength, then make your bends forming it into a square. Of course, every attempt possible should be made to keep each side 1/4 of this length, exactly.

In measuring the one before me, which I constructed, this total length, about the quad, is ~12.5cm.

However, here is a calculator I referenced in my constructions:

It is a java application, you must have java on your computer. Let me know if you can't access it and I will give you the figures it spits

out, 2.4ghz = 2400mhz. Just let me know what wifi channel you wish to
center on (frequency.)

However, since the 10mm square boom is metal and effectively "shorts" part of each element, the actual element length includes part of the diameter of the boom, thus adding approximately 5mm to each element length (not including the reflector and driven element). A VSWR sweep test would have shown the problem.
>

I have always used #8 wire as a boom on ghz yagis' (constructed a 7 element once.) Since the boom is at a current antinode (voltage node), I ignored the boom.

The boom you mention is rather LARGE, give the freqs in question.

One of my next projects is a GOOD VSWR meter for ghz ... unfortuantly, on the list of priorities here, it is low on the list ... :-(

I have just tended to take the % signal readings on the chans as good enough, and trimmed my antennas accordingly. I know, this does NOT take into account the functioning/power-fluctuations/antenna(s)/etc. of the AP over these ranges ...

But, excellent point, glad you mentioned it ... but you are right, my elements end up being filed down a bit from the figures the calculator spits out ...

Warm regards,
JS

Maybe, but more likely, not enough RF to do anything useful with an un-amplified meter.

What's missing from everyone's posting is what they plan to do with this field strength meter.

Let's play with the numbers. The average wi-fi access point belches about +12dBm (32 mw) RF into an antenna with perhaps 2dBi gain. The FSM has a gain of perhaps 0dB. At a distance of about 3 meters (10ft) the path loss at 2.4GHz is about 50dB which will deliver about -30dBm to the diode. On the most sensitive voltage range, the DVM has an input impedance of at least 1Mohm and can be treated like an open circuit load to the detector.

-30dBm into 50 ohms is 0.224 vrms. Transforming linearly from 50 ohm reference to perhaps 150 ohms loop antenna impedance yields about 600mv rms. (Note: I know this is a bad guess but it's midnight and I'm tired). Resonating the loop probably raises the impedance even higher, thus resulting in even more rectified voltage.

The resultant DC voltage will be about the same at about 600mv DC. However, for wi-fi use, the xmit duty cycle is quite low, sending just beacons, when there is no traffic moving. The 1000pf cap will need to be paralleled with a much larger cap in order to form a usable peak detector.

So, with a high imput impedance DVM the antenna and detector is quite efficient and can generate quite a bit of voltage. However, when the DVM is replaced with a non-amplified meter, the relatively low impedance of the meter shorts out the diode and signifigantly reduces the Q of the resonant loop antenna, resulting in much lower detected voltage.

I've built several transmitter hunt "sniffers" using almost exactly the same circuit, except that I use a hot carrier Schottky diode for the RF detector, and the cheapest Harbor Freight DVM (because it always gets destroyed or lost during the hunt). For 2.4GHz, I use a dish antenna, RF amplifier, step-up xformer (coax balun), diode detector, and DVM.

I also made a really ugly hack that uses a satellite TV signal meter.
<http://www.sadoun.com/Sat/Products/Accessories/Meters/SF95L-DSS-FTA-Satellite-Signal-meter.htm>
These work from about 900 to 1800MHz with a minimum detectable meter sensitivity of about -70dBm. They are comatose at 860 (cellular) and 2.4GHz but are great for 900 and 1900MHz (PCS) sniffing. The input port is connected to a 900MHz or 1.2GHz antenna of any sorts. The output goes to a 75 ohm load and a 12V battery (gel cell) through an RF choke.

What about surplus directional couplers and a bolometer set (various military versions used to be quite affordable)? Used to show up at

hamfests regularly too, covered 1 to 20 GHz or so in the kit; sorry
I forget the AN number at the moment, but it came with half a dozen
directional couplers for the various bands and lots of adapters.

Michael

I've built several. They work nicely and are a very important tool. My main inspiration was blowing up my Wiltron Model something SWR bridge and discovering the exhorbitant cost of a repair or replacement. The designs are sufficiently similar that I can substitute. Of course, it's not flat over many decades of bandwidth, but for fairly narrow bands, it's quite adequate.

>I have just tended to take the % signal readings on the chans as good
>enough, and trimmed my antennas accordingly. I know, this does NOT take
>into account the functioning/power-fluctuations/antenna(s)/etc. of the

I have a handy distant reference signal for 2.4GHz. It's line of sight and creates no Fresnel Zone issues, so it's useful for antenna testing. I start with my "standard" gain panel antenna and take a measurement. I then take the antenna under test, and compare. I rarely make an absolute level measurement. It's always relative to some other antenna of known characteristics.

The only problem is that I have to climb onto my roof to do the measuring. I'm currently at the tail end of radiation oncology (no big deal), which makes me kinda tired. I find myself somewhat tipsy on the roof, so no antenna measurements for a few more weeks. One might also suggest that it affects my math and memory, but they're currently just as bad as always.

>But, excellent point, glad you mentioned it ... but you are right, my
>elements end up being filed down a bit from the figures the calculator
>spits out ...

Suggestion: I always build a 3 element yagi first. Just the director, driven element, and reflector. With the antenna on the bench (after clearing off the chain saw and bicycle repair debris), I run a fairly wide sweep using a reflection coefficient bridge or VSWR bridge to an oscilloscope. I then trim the various elements for resonance. My sweeper has a marker generator, but an external generator (or wi-fi trash generator) can also be used. Adding additional elements does change the tuning a bit, but the really big frequency determining elements are the first 3 elements.
<http://802.11junk.com/jeffl/pics/home/slides/lab.html>
Incidentally, don't forget the mounting bracket. I just hate it when I prototype an antenna, and then find that the bracket, radome, potting foam, serial number sticker, or other irrelevent hardware detune the antenna.

Another trick that I use with wire rod type of antennas is to thread the end of the rods. Attached to these are threaded standoffs. These can be rotated to adjust the length of the elements. Also, don't forget to round off or chamfer the ends of each element to improve the bandwidth.

1AM. Time to give up before I start babbling nonsense.

Hmmm, max power for a wifi router is 1 watt!

Here is a full power one:

http://www.wirelessnetworkproducts.com/index.asp?PageAction=VIEWPROD&ProdID=1425

The router I presently use is "belching" 500mw into a 7.5db antenna
(well, I might question the 7.5db ...)

Throw out your access point man! Get a decent one ...

Regards,
JS

>Hmmm, max power for a wifi router is 1 watt!

I said "average wi-fi access point". 1 watt routers are relatively rare among the common home wireless routers. Most run about 32mw. Some Buffalo models run about 250mw. 2wire 2701 can run up to about 450mw. I think Enginius also makes one at around 1 watt.

The problem with this is what I call the "alligator" effect. An alligator is an animal with a big mouth and small ears. Running a 1 watt access point will make the xmitter heard over a much wider area than it can hear the responses from the clients. Unless the other end of the link (i.e. client radios) are also running the same high power level, the range will be limited by the clients tx power. In other words, the system gain and power levels in both directions have to be evenly matched to avoid turning the high power access point into what I consider to be no better than a jamming transmitter. If you need a slogan, you should use "only as much power as necessary" which doesn't mean crank it up to the max. Please print this slogan on a large sign and plaster it in front of your desk until the meaning sinks in. Also, note that most modern communications technologies includes automatic transmit power control (usually based on RX SNR or BER) to prevent alligators and systems like yours from becoming a problem.

>Here is a full power one:
>http://www.wirelessnetworkproducts.com/index.asp?PageAction=VIEWPROD&ProdID=1425
>The router I presently use is "belching" 500mw into a 7.5db antenna
>(well, I might question the 7.5db ...)

Turn down the power to about 100mw. The antenna is fine because it results in a symmetrical improvement in system gain. Also, give

yourself a slap on the wrist, repent your evil ways, and pray for
forgiveness.

>Throw out your access point man! Get a decent one ...

You haven't seen my office. I never throw anything away.

Yes, my AP's software allows for power control. Indeed, the AP will,
automatically, only supply enough power to make a, almost, error free
transmission link.

Having one side of transmission link error free is MUCH superior to have
both sides error prone!

However, although I have a pocketfull of various USB dongles, my
external USB wifi "card" is the highest output I could find which is
cost effective (@ 500mw.) External USB being powered off the USB buss
must stay 500ma (@ 5v) or below, total consumption. And, would more
than allow for a 1 watt USB dongle.

Here is a USB card to match my router:

http://www.data-alliance.net/servlet/the-90/802.11g-USB-802.11b-802.11n/Detail

Try one, you'll like it, "Mikey does!" <grin>

Regards,
JS

> http://www.n6mrx.com/Antenna/Cubical-Quad1.htm

Thanks for the link. The calculator works for me.

One remaining Q: how do I take into account the "pigtails" of the driven
element? A nice square loop is nice, but I've got to connect it to the
(relatively) big diode, and this requires a bit more wire from the loop to
the diode (on the + side of the loop) and to the meter connector (on the -
side). Do I include these wire lengths in the loop size calculation? Or
ignore them?

Or does the 1000pF cap effectively terminate the loop (re. size)?

Thanks.

Somewhat OT..   Oldtimers refer to a bottle of beer as an 807. Never
heard of a 6L6GT referred to that way. I suppose a whiskey bottle
could be called an 813.

Time for a couple of 807's.

I bow to your superior knowledge.

How do you know? Time spent busting tubes and looking inside? Old-time service and/or circuit design experience? Experience building tubes?

I'd love to see a detailed family tree for some of the more popular tube types.

How is the 6L6 metal type different internally from the 6L6G?

I beg to differ. Unless I missed something in my post-midnight scan of the specs, the wireless router's TX power is set and forget. If it receives an extremely strong signal level report in the 802.11 management packet, the power remains the same. The ability to do power control is there (because each device reports its RX signal strength and SNR) but very few access points even try.

>Having one side of transmission link error free is MUCH superior to have
>both sides error prone!

I beg to differ. You're creating un-necessary interference. Let's play with the numbers.

The commodity wireless router belches about +12dBm. Yours is allegedly +27dBm. Range doubles for every 6dB increase in TX power. Therefore, your TX range is:

(27 - 12) / 6 = 7.5

time more than would be with a commodity wireless router. In terms of coverage area, that's:

7.5^2 = 56.3

times the area. Assuming a uniform density of WLAN users in your vicinity, you're trashing 56.3 times as many users or systems as necessary.

You're also partly wrong about asymmetrical systems being superior. The transition between a fairly good BER or PER (packet error rate) is rather abrupt. What happens is that the AP simply slows down the data rate until the PER improves. Since the connection speed can be different in each direction, you'll get very good speed in one direction, and probably very slow speed in the other. In addition, things go insane above 54Mbits/sec connection speed. You might have enough signal to go faster than 54Mbits/sec in one direction, but if it's lacking in the other direction, the AP will simply revert to 802.11g and limit the speed in the stronger direction to 54Mbits/sec. That's not a problem as few systems can operate reliably at 54Mbits/sec beyond a few meters range and in the presence of interference.

Meanwhile, you're operating an alligator, jamming 56 times as many users as necessary, and polluting the airwaves with your overpowered xmitter. It's like operating a kilowatt xmitter in the middle of the QRP frequencies. Your stuff gets through, but nobody else's. I suggest you do the math, repent your evil ways, offer sacrifice to the radio gods on the hibachi, slap yourself on the wrist several times for penitence, and stop playing with the dark side.

>However, although I have a pocketfull of various USB dongles, my

>than allow for a 1 watt USB dongle.

You would do better with a directional antenna, so as to not both
pickup and deliver interference from other systems. Antennas with
gain also improve the system gain in both directions, thus preventing
the creation of an alligator.

>Here is a USB card to match my router:

>
>Try one, you'll like it, "Mikey does!" <grin>

Nope. Instead, I was instrumental in convincing at least one mesh
wi-fi vendor to reduce their poletop TX power, as they were causing
most of their own interference. Asymmetric systems suck.

I had this idea a while back, to thin out my stuff in what I think is
a useful and interesting way. Along the way I ended up having to buy
a bunch of new stuff as well (e.g. the brand new tune and load
variable caps). So take a look - might be a fun way to spend some
winter evenings.

Hey OM
I beg to differ. As any casual observer can see that peek is 330V and
the average would be 0.363 of the peak so that's 40 volts in my
calculator all day long, for a 3 tube string.

Lets take a square wave, the average would be 0.5 of peek, far lower
than 0.707 you are used to using. Even if it was full wave 120 cycle
dc, the average would only be 0.636 still lower than 0.707.

I tell you what. Take a diode and rectify the mains with it and
measure the DC voltage with a DVM, VTVM or a VOM and 0.363 of peak is
what you will get for a DC voltage on that meter. Or do the real
integral of the dv/dt and see for yourself.

The TV repair business I was in manufacturers put 50volt peak on a CRT
6.3volt filament, the average voltage was 6.3 volts. Lets see you RMS
that one.

Hey OM
What size gun did you has a 240watt? How did you get the electrodes so
close together? Isn't the center pin of an N connector really small?
Or maybe you making lots 7/8 inch of heliax cables huh? Where the
center conductor is like 3/8 in copper tubing. Where the 3/8 inch
copper tubing would conduct all the heat away from the insulation?

73 OM

You don't need to include diode lead length in the quad antenna calculations. The "loop" in the quad driven element is just an LC tuned circuit. It's as bit less than one wavelength around the loop and resonated to 2.4GHz by the tuning cap. The diode and other components do add some capacitance, which will lower the frequency somewhat, but the adjustment cap is substantially larger than these capacitances. For example, the off capacitance of a Schottky diode is about 0.5pf. You do need to keep lead length short as the added inductance will act as an RF choke.

However, instead of the giant diode, I suggest something smaller and better, such as a Schottky diode:
<http://www.adsemi.com/diodes/schottky_barrier_mixer_detector.shtml>
<http://www.macom.com/psc/jsp/ListParts.jsp?dataFile=mixing_detector_diodes.txt>

I was recently playing around with a 6DQ6 PA and it did not require
netralization with 2K ohms on the gridI didnt try anything higher than
that. Using broadband transformers will introduce some reactance that
may have to be tuned out. I suspect this may not become a problem
until you get up to 10M or so.

Jimmie

You are speaking of the specs on the USB card, I am speaking access
point ... and actually, I have never searched for power-throttling in
the USB card, I simply would not use it ... when the wife and I go out
and I search for APs, I want every possible mw in action, at a clients,
hotel, hospital, etc.

Let's not, I said what I meant, and meant what I said, one side error
free is better than two sides error prone.

>

No problem. I don't live in a dorm, trailer park, high-rise or
apartment building ... the software will automatically adjust to find
the best chan and recheck this decision, from time-to-time. If others
don't have that capability, they may wish to upgrade ... like I have
strongly implied, already, "If your AP is crap, toss it out!" I can't
imagine anyone here who failed to read specs before purchasing, however ???

> You're also partly wrong about asymmetrical systems being superior. The transition between a fairly good BER or PER (packet error rate) is rather abrupt. What happens is that the AP simply slows down the data rate until the PER improves. Since the connection speed can be different in each direction, you'll get very good speed in one direction, and probably very slow speed in the other. In addition, things go insane above 54Mbits/sec connection speed. You might have enough signal to go faster than 54Mbits/sec in one direction, but if it's lacking in the other direction, the AP will simply revert to 802.11g and limit the speed in the stronger direction to 54Mbits/sec. That's not a problem as few systems can operate reliably at 54Mbits/sec beyond a few meters range and in the presence of interference.
>

The equip can do b/g/n (b&g for the usb card in question, multiple computers here) With a windows widget to monitor my ap/card connection (transfer rate, errors, signal strength, etc.), I see it rise and fall from time to time. Sometimes I have seen the connection renegotiate from n to g to b ... however, at this same time AirSnare has went nuts. Seems wardriving teens are to blame ... <grin> I was a teen once, so long ago, I fear I may forget ... :-(

But, I will tell you, if ever I notice a problem with the errors (just looked, 3 errors), I will remember your words.

> Meanwhile, you're operating an alligator, jamming 56 times as many users as necessary, and polluting the airwaves with your overpowered xmitter. It's like operating a kilowatt xmitter in the middle of the QRP frequencies. Your stuff gets through, but nobody else's. I suggest you do the math, repent your evil ways, offer sacrifice to the radio gods on the hibachi, slap yourself on the wrist several times for penitence, and stop playing with the dark side.
>

Although, I am sure one or two of my neighbors are savvy enough to set their routers into non-broadcast mode of the SSID, and have WPA and filter on mac addresses, I just don't see the traffic/jam you speak of. But, like I say, if I do, I shall remember your words.

>> However, although I have a pocketfull of various USB dongles, my external USB wifi "card" is the highest output I could find which is cost effective (@ 500mw.) External USB being powered off the USB buss must stay 500ma (@ 5v) or below, total consumption. And, would more than allow for a 1 watt USB dongle.
>
> You would do better with a directional antenna, so as to not both pickup and deliver interference from other systems. Antennas with gain also improve the system gain in both directions, thus preventing the creation of an alligator.
>

No, I would NOT. When I take my laptop and USB antenna analyzer out to the antenna(s), I appreciate my omni. When I take my laptop and USB ODB II out to the car (in another direction), I appreciate my omni. When teens go by wardriving and trigger AirSnare warnings (and giving me one-hell-of-a-kick!), I appreciate my omni. You hang around with the old men here, beware the cynicism, it IS contagious!

>> Here is a USB card to match my router:

> wi-fi vendor to reduce their poletop TX power, as they were causing
> most of their own interference. Asymmetric systems suck.
>

Beware. Again you risk being controlled by the control freaks here. Glad it works for you, attempt to enforce it for me, we have a battle ... you know, there is equip and hacks available to open up chans far in excess of what is legal, I am sure some are savvy and use them ... perhaps teenagers? <straight face> I have even heard of some flashing their ap/cards with the foreign version of the software for them and exceeding power/chans ... shame on them! :-|

>> Regards,
>> JS
>
> Bah-Humbug (T'is the season).
>

However, you provide good discussion, and have valid arguments, I am sure--some will agree with and appreciate--perhaps even some which are state-of-the-art!

Personally, I would NEVER suggest purchasing an AP/card with less than 350mw capability. And, only then if you get one-hell-of-a-buy.

Warm regards,
JS

Sorry to have been so verbal. I could have summed that up rather
quickly, nicely and sweetly, I choose not to ...

You see millions of cell phones; You see a LOT of problems?

Regards,
JS

Not really a boatanchor question, but I am looking for some of the old
Motorola MC2831 FM transmitter chips which were discontinued a decade or
so ago. I'd take one of the MC2833 chips which are similar (they have a second
dedicated transistor instead of a tone generator on-chip).   I'd prefer
the DIP package but I'd even take an SMT that I could stick on an adaptor.

Anybody got a couple in their junk box?

You MUST take into consideration every single mm of the loops length!
Leads (apparently "pigtails") ARE the loop ...

But, nothing stops you from being creative. The guy whos'
construction(s) we are following did have about optimum parts to work
with--you will just have to be "creative" ... good-luck.

Warm regards,
JS

A not-uncommon scenario, I think. I've seen APs which put out a signal that has useful strength for blocks, and yet you have to be within about 100 feet of them to establish contact with a typical client system.

This same issue is significant in other bands, as well. My area's ham-radio VHF/UHF repeater coordination group has a firm principle... a coordinated repeater's transmit coverage and receive coverage should be consistent. Having an ultra-high-powered transmitter simply causes interference well outside the repeater's practical use range.

Having overly-sensitive receivers can also be a problem, albeit a
lesser one, as it means that the repeater can be "keyed up" by remote
stations too far away to hear the repeater properly. It's less of
a problem, though, as most repeaters use CTCSS tone squelch these days
and won't respond to signals intended for co-channel repeaters with a
different CTCSS tone. I don't think this is an issue for 802.11
access points at all.

Consolidated Electronics online catalog says they have the MC2831 in stock
(http://www.ceitron.com/semi/semi.phtml?part=MC2831).

>You see millions of cell phones; You see a LOT of problems?

Oh yes, I certainly do see problems. They're well hidden and mitigated in various ways. For example, if the error rate climbs, the adaptive tx power control cranks up the power on both the handset and the cell site end. If it persists, you get disconnected. Rather than have the user sound like they're talking while gargling ball bearings, the cell site just pulls the plug. Incidentally, the tx power control algorithm is rather messy as it has to handle different data types, at different rates, all while doing its best not to drain the handset battery. One the cell site end, it's no better as the power consumption of a typical cell site is non-trivial.

Problems? Well:
<http://www.roughlydrafted.com/2008/08/28/the-inside-deets-on-iphone-202-and-dropped-calls/>
Hmmm... power control algorithm again.

Todays typical cell phones run about 150mw max average power output (according to the FCC ID data). Some are even less. None are anywhere near the 600mw legal maximum. If they could, you would have a dead battery within about an hour. (Do the math).

Back to wi-fi and your setup. Sure, you'll have fairly good preformance with a high power setup. 14 times the usual power is bound to do some good. However, I suspect your neighbors are not so thrilled and will probably also be shopping for higher power hardware. It will be like an arms race, where the biggest bomb allegedly wins. Dealing with mutual interference is no fun, especially with only 3 available non-overlapping channels.

About a year ago, I was trying to find the source of a very strong 2.4GHz signal in the downtown Santa Cruz mall area. Wi-Fi communications among the various coffee shops and hot spots was ummm.... a challenge. I eventually traced it down to a tall residential hotel and a 2.4GHz cordless digital phone running what I guess was a 10 watt power amplifier. Instead of a cell phone, this person decided to provide his own cordless phone service that covered the entire downtown area. You could see it anywhere but as is predictable, his useful range was limited by the handset power, which was well less than 10 watts. I'm not going to go into detail on exactly what happened, but it should be sufficient that he's now aware of the problem he was causing and is off the air.

Be the first in your neighborhood to dominate the airwaves:
<http://www.ssbusa.com/kunamp1.html>
Cool... 50 watt linear on 2.4GHz. Now, we're cooking.

>This same issue is significant in other bands, as well. My area's ham-radio VHF/UHF repeater coordination group has a firm principle... a coordinated repeater's transmit coverage and receive coverage should be consistent. Having an ultra-high-powered transmitter simply causes interference well outside the repeater's practical use range.

Good plan but there are problems. Most hams these daze use walkie talkies with perhaps 1 watt of TX RF. The typical repeater is running perhaps 10 to 40 watts out (after the duplexer). The walkie can hear the repeater almost anywhere, but when trying to talk, they drop in and out all the time. The mobiles, which run more power, are usually well matched to the repeater's tx power. I've suggested adaptive tx power control (to preserve battery power) on our 2 meter repeater, but nobody wants it.

>Having overly-sensitive receivers can also be a problem, albeit a lesser one, as it means that the repeater can be "keyed up" by remote stations too far away to hear the repeater properly. It's less of a problem, though, as most repeaters use CTCSS tone squelch these days and won't respond to signals intended for co-channel repeaters with a different CTCSS tone.

We had a co-channel user that was running carrier squelch. It took only about 7 years of constantly pounding on the trustees before they would install PL. They lied on their NARCC application claiming they had a functional PL system. The experience taught me a few things, one of which is that hams generally make lousy RF neighbors.

>I don't think this is an issue for 802.11 access points at all.

No, it's not for most home systems. There's a similar coexistence problem with mesh networks and municipal networks. Neither of these scale very well. They work ok with a small number of repeaters, but rapidly foul up as the usage, traffic, and number of repeaters increases to the point of mutual interference. Details and a rant on request.

There's also a problem with wi-fi and omnidirectional antennas. These pickup and spew inference from all direction equally well. Same with reflections and multi-path. If the main area of operation can better be covered with a directional antenna, then it should be used. It may create hidden nodes, but those can be handled by enabling flow control.

>Tim, I solder these on the N connectors all the time with no problems.

In past life, in a land far far away (Smog Angeles), I once worked for and later ran a comm shop. At the time, UG-21/U male N connectors were commonly available and in fashion. Our 460MHz repeater systems were full of them so I had plenty of experience in soldering, assembling, and repairing these connectors. I don't want to remember all the 25 mile joy rides up the fire road to Santiago and Mojeska Pk just to fix a problem caused by a flakey UG-21/U coax connector. Well, to be totally accurate, I had equal problems with soldered PL-259 connectors. I fought these problems for years because I assumed there was no better way.

Meanwhile, I was also involved in an avionics shop (on the business end). They were slowly switching from soldered to crimp type connectors. The owner insisted that is was worth the effort because the number of connector failures and rework had approached zero with the crimp type. I became a believer overnight.

Many years later, I designed a few marine radios for the USCG. The specs would tolerate either solder or crimp. So, I asked which they preferred. Crimp was the answer, because they never could teach the techs how to properly solder a connector, while the crimper always does it right. All our radios used crimp connectors, even on the inside.

Roll forward more years and we have 10Base2 and 10baseT ethernet. The former uses UG-21/u N connectors. The latter uses BNC. The nice yellow coax cable with the flakey connector was a constant source of headaches. The crimp type BNC's never failed (unless abused).

I'm not sure what to suggest. With skill UG-21/u can be made to work. With luck, they can even be kept working in the field. However, I'll take crimp type any day, especially after many year of experience dealing with both.

Seems to me that would introduce another set of incompatibilities.
People out on the fringe area of the repeater's coverage would be able
to hear repeated signals from weak transmitters (e.g. HTs), but if the
repeater saw a strong input signal from a mobile (or an HT near the
site) and dropped its transmitter power, the repeater coverage area
would shrink abruptly and those users out around the edges could lose
coverage. This could re-create the "hidden node" problem in a new way!

I don't think adaptive power management can work reliably in the
absense of a signal-quality feedback from each station which is
accessing the repeater/AP.

Grrr.   <Worf> "Romulans have *no* sense of honor." </Worf>

Our system (W6ASH, SPECS, at El Camino Hospital in Mountain View)
switched over to PL-tone-only years ago, and it helps in numerous
ways... the absence of noise-initiated kerchunking is a real blessing.
I've preserved the ability to switch the repeaters over to
carrier-sense-only in an emergency but really don't expect to ever
need to use this feature.

>   The experience taught me a few things,
>one of which is that hams generally make lousy RF neighbors.

Some are lousy neighbors, lazy and self-centered. Others hold
themselves and their equipment and operation to very high standards. I
think it depends very much on the individuals involved, on their
attitudes, and on their level of prior experience in supporting a
real-world user community.

I believe you!

My impression is that a limited set of mesh repeaters, and a plentiful
set of direct backhaul links on a different (non-interfering) band,
works out rather better.

Yeah, personally, I could handle a cell phone 2x to 3x the size, most of
it battery ... my cellphone is 300mw out (max, but variable, as needed,
as you state), I read those specs before purchasing, also. 4 hours max
talk time (like if your sitting right under the tower?) is no problem
for me, mine averages 2-3hrs, but I have a pocket charger, takes two AA
high output recharge-ables (you can chuck alkaline in if needed) and is

quick, chat while charging, so never without power (did I mention 2 week standby time?), now ask the wife, you get another answer ...

>

My son and I, once or twice a year, attend a game fest. There is more high power equip set up than you can shake a whatever at ... doom, heretic, diablo, etc. (you can tell, I like the old ones :-( ) nets all off separate APs, the wifi cards are simply uncountable--if you think thats nuts, attend a gaming convention in Nevada, frankly, I would have to state, from REAL hands-on, the problems you state just don't exist to a REAL degree ... if they/it did, they would be fixing that now (more chans, tighter packet packing/encryption, more-adaptable, spread spectrum, etc. Remember, networking has NOT EVEN reached its' infancy, yet!) Without a doubt, there are conflicts and lost packets--you just never notice them--now, if everyone there started, separately, watching a HD movie, most-likely no joy ... :-(

Besides, my neighbors are idiots (technical idiots, I admit, I like a couple of 'em), I doubt they do anything but email/surf and download an illegal movie/song now-and-then -- well, I suspect them of porn--but I am like that yanno? Suspicious.

But hey, if everyone agreed with me, I would NOT be here, and this would NOT be fun--did I mention it would be boring? <wink>

Warm regards,
JS

All the problems you state would disappear with the correct algorithms

controlling the packets/encryption/compaction ... there is just not
enough interest to put together a team together to do it, and a
for-profit organization would go broke doing it ... and, you can't get
everyone to agree. The (A)ncient (R)etarded (R)adio (L)aggards) don't
see a need--you see, no brass is required ... :-(

Regards,
JS

Good point, but that's not what I had in mind. I was aware of the problem and suggested that the power control be run by a micro. The algorithm needs to be worked out, but basically, the weakest signal sets the power level. The range of power adjustment also will not be huge or large enough to have much of an effect on distant stations. Our current 60 watt amplifier might have the power output reduced to about 20 watts or 4.5dB power reduction. That's less than one S-unit and probably wouldn't be noticeable even by distant stations. However, it will make a huge difference in power consumption and battery operation run time. There are a few other economies that can be thrown in, such as having the repeater always ID in low power. Of course, there are complications, such as the mobiles and handhelds not reporting their RX signal quality, which makes deciding the repeater power output somewhat problematic when dealing with the traditional broken radios. (Same people, same radios, same problems, same club net, every time). Incidentally, this was suppose to be a minor feature of a proposed repeater voting system, which is another can of worms.

>I don't think adaptive power management can work reliably in the
>absense of a signal-quality feedback from each station which is
>accessing the repeater/AP.

Yes it can. I intentionally reduced the repeater TX power during a club net from 60 watts (before the duplexer) to about 20 watts. Nobody said anything, there were no complaints, and nobody noticed, even after I mentioned it after the close of the net. As long as I don't run the power output to near zero, it can me made to work, even if the power level is set manually with a touch tone command.

>>We had a co-channel user that was running carrier squelch. It took

>

>Grrr.   <Worf> "Romulans have *no* sense of honor." </Worf>

Actually, it was far more stupid than it appears. We had several of the club politicians pounding on the alleged trustee of the repeater, who literally didn't care, didn't communicate with the rest of the organization, broke numerous promises to take it up with the board, and so on. Complaints to NARCC went to the trustee with predictable results. We were simply talking to the wrong person. One day, we caught the right person on the air working on the repeater. He was informed of the situation, after a few emails and the usual miscommunications, the PL decoder magically appeared. As would be expected, the initial transistion was slow. First there was no-PL during their club nets. Later, it became full time. There was also some work done on placing a notch in the antenna pattern in the direction of Santa Cruz. That has worked quite nicely.

>Our system (W6ASH, SPECS, at El Camino Hospital in Mountain View)

>ways... the absence of noise-initiated kerchunking is a real blessing.
>I've preserved the ability to switch the repeaters over to
>carrier-sense-only in an emergency but really don't expect to ever
>need to use this feature.

That alleged benefit is that no PL allows visitors and hams with antique hardware to use the repeater. We have a control code that is available to anyone that will temporarily disable the PL for a specified time period. It actually does get used by some hams who apparently plan on being buried with their ancient radios and have no intention of ever selling them.

It varies. I consider myself a good example of one of the lousy RF neighbors, so I know they exist.

>My impression is that a limited set of mesh repeaters, and a plentiful
>set of direct backhaul links on a different (non-interfering) band,
>works out rather better.

Sure, but that's not the way most municipal wireless networks are umm.... engineered. Most are single channel, store and forward repeaters. The problem is that if you're perhaps 3 nodes away from where it hits the wired internet, you will have 4 identical duplicated packets flying through the air. If everyone can see everyone else (as is the case with omni antennas on office rooftops), only one of those radios can be transmitting at a time. That means that you would be

hogging at least 3 times the shared bandwidth (airtime is shared) to
deliver one lousy packet. Add the problem of trying to create the
ultimate geographic routing algorithm, and mesh networks have a
propensity to fill the airtime with duplicates, retransmissions, and
junk. The worst of the worst are broadcasts, noteably ARP requests,
which go everywhere. I was monitoring what was coming out of Google's
Mtn View network and finding about 60% of the airtime occupied by ARP
requests. Of course, when the proponents of municipal wireless find
that there are holes in their coverage, they just add yet another
store and forward mesh repeater. Eventually, the density is high
enough for the mesh repeaters to start interfering with each other.
Since this is difficult to diagnose, the usual solution is to increase
the TX power of the mesh node. That does the opposite of what might
be expected, but until the numbers are in for availability testing,
everyone just assumes that more power is more better. It took quite a
bit of arguing to convince one mesh operator to reduce their power and
even more to demonstrate that it worked. As an example, see the data
and conclusions from the old MIT RoofNet at:
<http://pdos.csail.mit.edu/roofnet/doku.php?id=interesting>
Note the probabilies of actually delivering a packet through just one
hop. Yech.

I couldn't resist and just had to rant. But, it was worth it.

Onward to another thrilling day of doing battle with QuickBooks and my
traditional end of the year billing nightmare...

Would it? A lot of amplifiers don't change their power consumption all that much, especially if they're designed for saturated operation (i.e. if you reduce the input drive, they either distort, or drop into linear mode and dissipation goes up).

if you have an amplifier designed for variable power output, then what you say might be a good idea.

Weller manufactures the following of that type of solder guns:

8200 = 140/100W
D550 = 260/200W
D650 = 300/200W

See http://www.cooperhandtools.com/brands/weller/index.cfm

I have an 8200. They make plain copper and iron-clad copper tips (the iron-clad tips last longer). The beauty is that, when your only tip goes open and the local hardware store is closed and you HAVE TO solder something, 12ga solid copper wire can be formed into a tip. :)

I still have a dual power (500/250) model Weller gun that a friend bought while we were in the Air Force. He took it out of the package and dropped it on the floor accidentially. A tiny piece of non functional plastic busted off the top, so he threw it in the trash can (he was having a bad day). I pulled it out of the trash, plugged it in and showed him that it still worked fine. I then offered it back to him. He wanted no parts of it. I'm still using it to this day. That 500 watt heating range actually comes in handy now and then.

  Hey OM
  I beg to differ. As any casual observer can see that peek is 330V and
  the average would be 0.363 of the peak so that's 40 volts in my
  calculator all day long, for a 3 tube string.

  Lets take a square wave, the average would be 0.5 of peek, far lower
  than 0.707 you are used to using. Even if it was full wave 120 cycle
  dc, the average would only be 0.636 still lower than 0.707.

  I tell you what. Take a diode and rectify the mains with it and
  measure the DC voltage with a DVM, VTVM or a VOM and 0.363 of peak is
  what you will get for a DC voltage on that meter. Or do the real
  integral of the dv/dt and see for yourself.
```

The TV repair business I was in manufacturers put 50volt peak on a CRT 6.3volt filament, the average voltage was 6.3 volts. Lets see you RMS that one.

n8zu

Ray,

=20

You obviously do not understand the meaning of RMS as you are confusing = the average voltage with the RMS voltage. In a resistive circuit, the = RMS voltage of any waveform will produce identical _heating_ as a DC = voltage of the same value. This is an important point which is often = overlooked, and it is why measuring the RMS value of a waveform is = difficult. Let's start with some numbers but avoiding the use of = integration...

=20

Assume we have an AC voltage described by:

=20
